Problems/Solutions

- Problem: It doesn't seem to work!
- Solution: Perhaps QuickNote has been turned
                      off.   Make sure the switch in the lower
                      left of the window is in the on position.
- Problem: It causes problems with a certain
                      application.
- Solution: From the preferences dialog you can
                      create a list of applications that cause
                      problems while using QuickNote.   You
                      can add the application to a list of
                      special applications (see Customizing
                      QuickNote above).
- Problem: Some command keys no longer work
                      with a certain application.
- Solution: Make sure you have not set up
                      any "Hotkeys" using the same key(s)
                      used by an application.
- Problem: There is nothing listed under the Plugins
                      menu.
- Solution: Make sure the folder "QuickNote Plugins"
                      is in your System Folder and contains
                      some plugin files (there are several plugins
                      that should have come with QuickNote, see
                      the PlugIns chapter for more information).
