

# sing DOCMaker Document Patch for Mac OS 8.5

October 1998

The DOCMaker Document Patch for Mac OS 8.5 will quickly update existing DOCMaker documents for use under Mac OS 8.5. After patching, the documents will still work under older Mac OS versions. The patcher replaces the horizontal navigation scrollbar in those documents that have more than one chapter. This scrollbar needs updating for use under Mac OS 8.5. The symptoms that are fixed by this patch are long pauses in the Macintosh after using the popup menu in the navigation scrollbar. This patch is only needed for DOCMaker documents whose version number is 4.8.3 or earlier.

To use the patcher, just drag your documents to the patcher and they will be updated as needed. Make sure that none of the documents being dragged to the patcher are running at the time. You may drag any number of documents to the patcher.

You may also drag folders containing DOCMaker documents to the patcher. All DOCMaker documents contained inside the folder will be patched. The patcher will leave ALL other documents alone and unchanged.
