### 1.2 MpegA-Gui.Guide: How does it work?

Well, it is pretty easy to handle. When you start the Program a window opens with some gadgets:

LISTVIEW:

---

~~~~~

A big Listview (relativ ;) shows you, what songs are found and ready to play. Well, be sure, you have really MpegFiles in the List. I don't check them before the Gui puts them in the list.

ADD:

~~~~

If you press on 'Add' a FileRequester will occur and you can (multi)select all MpegFiles you want.

DEL:

~~~~

With Del, you can remove the selected entry from the list

CYCLEGADGET:

~~~~~

A CycleGadget which tells the Gui how to play those songs. There are four options:

Play the actual File: Play only once the selected File  
 Loop the actual File: Plays the selected File 5 times  
 Play the whole List : Plays all Files just once  
 Loop the whole List : Plays the whole List 5 times

I think 'Play' and 'Stop' are also clear... but note: The Commands 'Break' and 'Status' MUST be present in the CommandDirectory!

DoubleClick on an entry:

~~~~~

A doubleclick on an entry in the list and a little window will occur. In this window you can select the time where MpegA should begin to play or you can set the parameters to decode a Mpeg-File. Note: When you select 'Silence' your Amiga could stay for a while. When MpegA has completed, your Amiga will work as normal.

Help-Key:

~~~~~

If you press the Help-Key, MpegA-Gui will try to load the MpegA-Gui.Guide. So if you like this, be sure you placed the Guide either to HELP:{yourLanguage} or to the Progdir.

### 1.3 How to install this Program

Just place it where ever you like and start it. First MpegA-Gui asks for MpegA the Program and then for the Path. Then go to the PullDownMenu and select Preferences to switch some important or unimportant things on or off btw. change the Volume etc...

When you quit the Program, MpegA-Gui saves all Settings automatically incl. the last used Position of the Window. If you have some Reports or suggestions for it, please let me know it. Do you have fun to translate some Catalogs or this damn DocFile to your own Language, please do it! And, of course, let me know it... Am I nosy?? No, I just want to know EVERYTHING...:\_)))))

- 
- Prefs: Gadget for Headertype (AIFF, WAVE)
  - Prefs: Gadget for OutputFile
  - Little 'optic-bug' fixed in menus
  - A selected entry will keep cursor
  - Added saveable and loadable Playlist
  - Window changed to AddWindow. So you can drop now your Mpeg-Files directly to the window
  - Gui can be iconified now with Exchange
  - SizeGadget added
  - Bug fixed (stop MpegA)
  - DoubleClick on an entry will open a requester to jump to some positions in a File ←
-
