

APPLESCRIPT

UltraFind is fully scriptable. It can be queried by other applications and will return search results to any scriptable application. If you would like to know more about scripting UltraFind, or download example scripts for UltraFind, please see:

DRAG & DROP

UltraFind supports Drag&Drop. You can drag files out of any of the list windows and drop them into folders or volumes on your desktop. The Data Reader is also Drag-aware and allows you to select paragraphs of text and drag them out of UltraFind.

As well as dragging files OUT of UltraFind, you can drag files IN to UltraFind. When in the Finder, you can drop any files onto UltraFind's icon to have them load automatically into the list window. If you have a list window open you can also drag files from the desktop into a list window. You will see UltraFind track the file's location.

To enable Drag&Drop, hold your mouse button down over a file (or selection of files).

- ✓ **In UltraFind's Hierarchic View, you can also drag files between folders.**
- ✓ **You can drop files and folders from the Finder onto the 'Confine' button to set it**

Drag&Drop requires System 7.5
