This program used at your own risk. The authors aren't responsible, for any troubles that cause this program. We made always, how in this program aren't contain errors, but as everybody know: theres no faultless program!

1.2 introduction

Introduction

=====

You have dispose of a heap textfiles, this textfiles you must do read to over, because you want to change a part of text inside of this textfiles an another part of text.

For this operation you need a texteditor, and examine itself by one... or start this program.

Be need give you the path and part of text (or pattern) only. This stuff examine on the path the files, and you will get a list of find files and strings. It's make in the background.

How to use

=====

After start of the program, opening the main window. To the Path set the searching-path with the "?" button to be find on the right side, or write into string gadget.

Be need give, the string what you search, the part of text, the program will search on path in the files.

Isn't need, but give a Pattern also. The * character whatever file. If you want to search in .txt files then write into this string gadget *.txt only.

The searching start with Begin search button. If you don't disabled, then opening a small progress indicator, and visible the actual searching operation. The operation break anytime with the ESC key, in this case until the stopping can be found and equal files are appears in the listview window.

If the search is done (end, or press the ESC), opening a listview, the List of files. A list the match files, appear with the byte-positions (in one-file more possible).

Until, you don't close this window, till enabled the Save file list button and the Printing list button also, on the main window. In this time can you saving and printing!

Other buttons, switches on the main window:

With the About button can you get more informations from program and authors.

The Progress switch in off condition be disable the progress indicator, so the search will fast.
