

HdkAct - helpC activator

The HdkAct program allows you to set helpC compiler options in an easy to use window, that include GUI access to all of the helpc switches.

The following options are available :

Input - Open a new input file for the compiler. You can specify the file name yourself in the edit box on the right, or click on the Input button to choose from a directory list.

Target Combobox - Choose the target for the compiler.

Pascal/C/C++ Radio buttons - Choose the external definition file that will be created, if any.

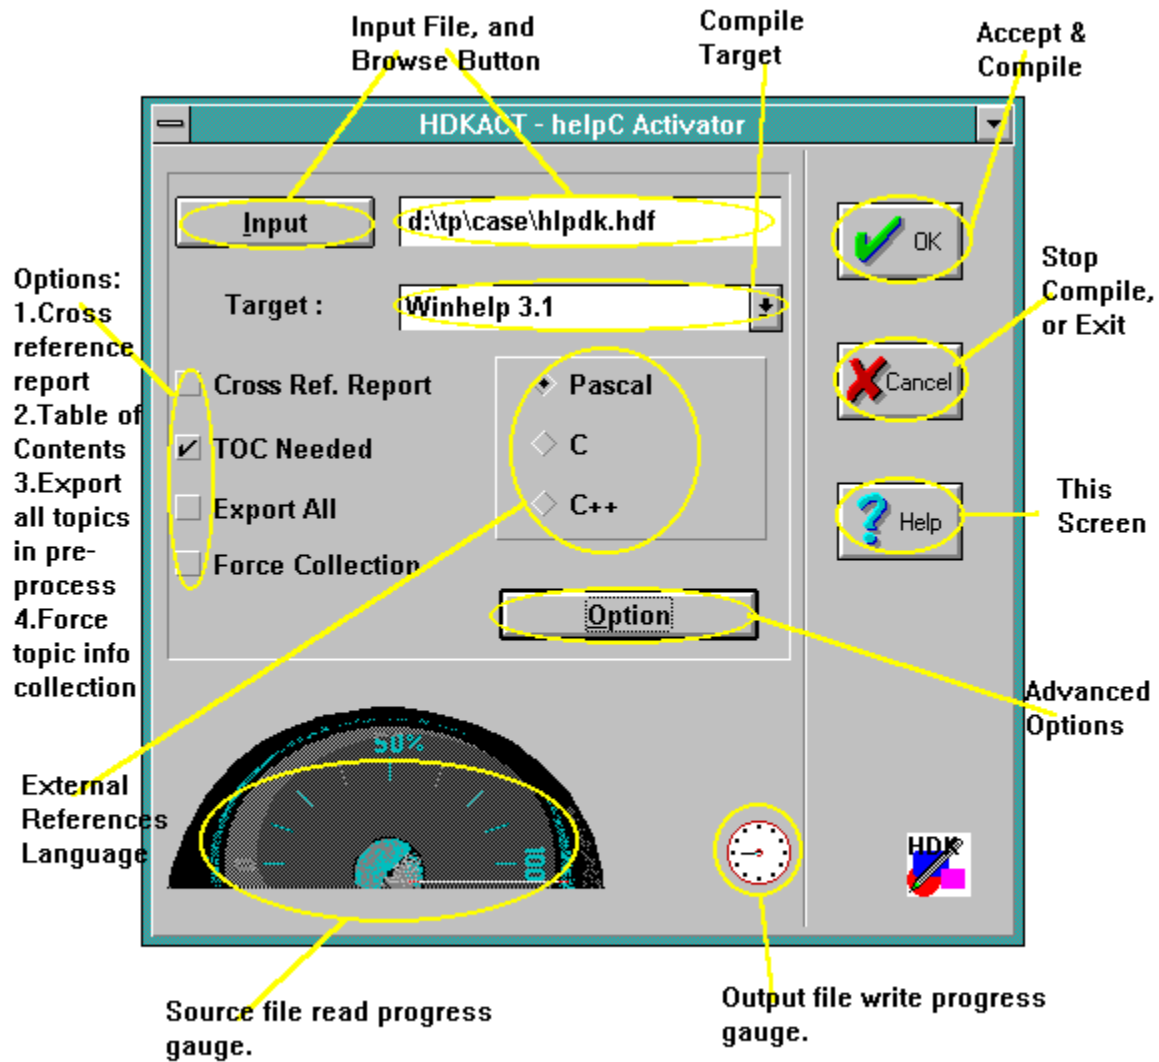

Cross Ref Report - Check to create a cross reference report.

TOC Needed - Check if your source includes a ".insert toc" statement.

Export All - Check if all topics should be exported when the target is PreProcess.

Force Collection - Check if you want the compiler to collect topic information regardless of the error level.

Options Button - Click here to get to the [Options](#) screen.

Extended/Advanced Options

Use this screen to set advanced/extended options to the helpC compiler.

The Exception handling error level that will be performed by the compiler.
