About WScan

McAfee's WScan program detects, identifies, and disinfects known DOS computer viruses. WScan checks memory and both the system and data areas of disks for virus infections. If WScan finds a known virus, in most cases it will eliminate the virus and fully restore infected programs or system areas to normal operation. To obtain a list of viruses that WScan detects, choose [Scan|Virus List](#) or click the [Virus List icon](#)

In addition, WScan can also assign validation and recovery codes to files, and use those codes to detect and treat infection by new and unknown viruses. If WScan has stored validation or recovery data for files, it may detect file changes and warn that infection by an unknown virus may have occurred. WScan can also use the recovery information to remove new or unknown viruses and restore infected files, master boot records (MBRs), and boot sectors.

WScan is designed to check for pre-existing infections of known and unknown viruses on floppy, hard, CD-ROM, and compressed (SuperStor, Stacker, DoubleSpace, and so on) disks on both stand-alone and networked personal computers, as well as network file servers. If you have a Novell NetWare/386 V3.11 or 4.0 file server, you may want to use the NetShield virus prevention software NetWare Loadable Module in conjunction with WScan.

Starting WScan

To start WScan

In the Program Manager, double-click the WScan icon.

The WScan main window appears.

As it loads, WScan performs a self-check of its program files to verify their integrity, then scans your system memory for viruses automatically as it loads. It displays the scanning messages in the Report Summary area and displays any messages in the Messages area of the main WScan window.

WScan does not check diskettes or fixed disks at startup. To scan disks, see Scanning your system.

If you find a virus

Virus in memory

DO NOT RUN ANY OTHER PROGRAMS - especially if the virus is found in memory.

If WScan finds one or more viruses, you will see a message in the main WScan window. Do not panic, even if the virus has infected many files.

If a virus is resident in memory, DO NOT use WScan to remove it because Windows or other system files might be infected and you risk spreading the virus. If you have detected such a virus, restart your computer and run the command line Scan program from your clean startup diskette.

If you are at all unsure about how to proceed once you have found a virus, contact McAfee Technical Support

We strongly recommend that you get experienced help in dealing with viruses if you are unfamiliar with anti-virus software and methods. This is especially true for critical viruses, master boot record (MBR), and boot sector infections because improper removal of these viruses can result in the loss of all data and use of the infected disks.

[False alarms](#)

Cleaning your system

Clean your system when you know or suspect that a virus infection has occurred. If a virus is resident in memory, the most secure way to clean your system is to turn off your computer and start from a clean start-up diskette. However, you can securely use WScan to clean infections if:

- ▶ You are absolutely sure your system is virus-free (no viruses are resident in memory), AND
- ▶ You are *absolutely sure* that no system or WScan files are infected and spreading the infection when running.

[Making regular backups](#)

Upgrading McAfee software

Unfortunately, new viruses (and variants of old ones) appear and circulate often in the personal computer community. Fortunately, McAfee updates the VirusScan programs usually monthly, but more often if many new viruses have appeared. Each new version may detect and eradicate as many as 60 to 100 new viruses, and may add new features. To find out what is new, review the on-line documentation files.

List of installed files

WScan Files	Description
AGENTS.TXT	List of McAfee authorized agents.
CLEAN.DAT	Virus removal data file required by WSCAN.EXE.
COMPUSER.TXT	Explains how to obtain CompuServe membership.
FILE_ID.DIZ	Description of VirusScan used by some BBS software.
FILENAME.TXT	Explains new McAfee BBS file name conventions.
LICENSE.TXT	Explains how to license VirusScan.
NAMES.DAT	Virus name data file required by WSCAN.EXE.
PACKING.LST	Contains a list of all files, including validation information.
README.1ST	Late-breaking information and new instructions not contained in this manual.
REGISTER.TXT	Explains how to register VirusScan for your use.
SCAN.DAT	Virus string data file required by SCAN.EXE.
WSCAN.EXE	The WScan program.
VALIDATE.EXE	Used to check VirusScan programs for authenticity.
VALIDATE.TXT	Explains how to run VALIDATE.EXE

Scan (DOS) Files	Description
SCAN.EXE	The Scan command line program.

VShield Files	Description
CHKVSHLD.EXE	Checks for presence of VShield and VShieldCRC in memory.
VSHIELD.DAT	Virus string data file required by VSHIELD.EXE.
VSHIELD.EXE	The VShield program.
VSHIELD.TXT	On-line manual for VShield.
VSHLDCRC.EXE	The VShieldCRC program.
VSHLDWIN.EXE	Used by VShield and VShieldCRC to display messages within Windows.

Scan command line options

Click the command for its WScan equivalent, if applicable.

Option	Description
<code>/?</code> or <code>/HELP</code>	Display help screen .
<code>/ADL</code>	Scan all local drives (except floppy drives).
<code>/ADN</code>	Scan all network drives.
<code>/AF {filename}</code>	Store validation/recovery codes in filename.
<code>/ALERT {servername}</code>	Alert the servername server about infected files.

<u>/ALL</u>	Scan all files, not just standard executables.
<u>/APPEND</u>	Append to, rather than overwrite, the file (/REPORT).
<u>/AV</u>	Add validation/recovery data to program files.
<u>/BOOT</u>	Scan boot sector and master boot record only.
<u>/CF {filename}</u>	Check validation/recovery codes in filename.
<u>/CLEAN</u>	Clean up infections in boot sector, master boot record, and files when possible.
<u>/CV</u>	Check validation/recovery data in files.
<u>/DEL</u>	Overwrite and delete infected files.
<u>/EXCLUDE {filename}</u>	Exclude from scan any files listed in filename (with /AV).
<u>/FAST</u>	Speed up VirusScans scanning; may detect fewer viruses.
<u>/LISTEN {servername}</u>	Load Scan and wait for a command from the servername server.
<u>/LOAD {filename}</u>	Use Scan settings stored in filename.
<u>/LOG</u>	Save date and time VirusScan was last run in SCAN.LOG.
<u>/MANY</u>	Scan multiple floppies.
<u>/MOVE {directory}</u>	Move infected files to directory.
<u>/NOCOMP</u>	Skip checking of compressed executable files created with the LZEXE or PKLITE compression programs.
<u>/NOMEM</u>	Skip memory checking.
<u>/PAUSE</u>	Enable screen pause.
<u>/PLAD</u>	Preserve last access dates on Novell drives.
<u>/REPORT {filename}</u>	Create report of infected files found during scan in filename.
<u>/RF {filename}</u>	Remove validation/recovery codes in filename.
<u>/RPTCOR</u>	Add list of corrupted files to the report file (/REPORT).
<u>/RPTERR</u>	Add list of system errors to the report file (/REPORT).
<u>/RPTMOD</u>	Add list of modified files to the report file (/REPORT).
<u>/RV</u>	Remove validation/recovery data from files.
<u>/SHOWLOG</u>	Display information in SCAN.LOG.
<u>/SUB</u>	Scan subdirectories inside a directory.
<u>/VIRLIST</u>	Display list of viruses detected by VirusScan.

Error codes

After WScan has finished running, it sets the DOS ERRORLEVEL. You can use the ERRORLEVEL in batch files to take different actions based on the results of the scan. See your DOS documentation for more

information.

WScan returns the following DOS ERRORLEVELs:

Error	Description
0	No error occurred and no viruses were found.
1	An error occurred while accessing a file (reading or writing).
2	A VirusScan database (*.DAT) file is corrupted.
3	An error occurred while accessing a disk (reading or writing).
4	An error occurred while accessing the file created with the /AF option; the file has been damaged.
5	Insufficient memory to load program or complete an operation.
6	An internal program error occurred.
7	An error occurred in accessing in international message file (MCAFEE.MSG).
8	A file required to run VirusScan, such as SCAN.DAT, is missing.
9	Incompatible or unrecognized option(s) or option argument(s) specified in command line.
10	A virus was found in memory.
11	An internal program error occurred.
12	Error occurred while attempting to remove a virus, such as no CLEAN.DAT file found, or VirusScan was unable to remove the virus.
13	One or more viruses was found in the master boot record, boot sector, or file(s).
14	The SCAN.DAT file is out of date; upgrade VirusScan data files.
15	VirusScan self-check failed. It may be infected or damaged.
16	An error occurred while accessing a specified drive or file.
17	No drive, directory or file was specified; nothing to scan.
18	A validated file has been modified (/CF or /CV options).
19-99	Reserved.
100+	Operating system error; WScan adds 100 to original error number.

About McAfee

Founded in 1989, McAfee Inc., is the leading provider of tools for productive computing for the DOS, OS/2, and Windows environments. Our anti-virus products are used by more than 16,000 corporations worldwide. Our utility products provide data security, automated version updating, and system inspection and editing. McAfee is also the pioneer and leading provider of electronically distributed software. All of McAfee's products can be purchased through dealers or downloaded from bulletin board systems and on-line services around the world.

McAfee does not stop at developing the world's best anti-virus and utility products. We back them with the industry's best service and technical support. Product support is provided by a full-time staff of virus researchers, programmers, and support professionals, and delivered directly by McAfee or our network of more than 150 authorized agent offices in more than 50 countries worldwide.

Before you contact McAfee

Have the following information ready

- Program name and version number.
- Type and brand of computer, hard disk, and any peripherals.
- Version of DOS, along with any TSRs or device drivers in use.
- Printouts of your AUTOEXEC.BAT and CONFIG.SYS files.
- A printout of the contents of memory, from the MEM command (DOS 4.0 and later) or a similar utility.
- A description of the exact problem you are having. Please be as specific as possible. If you cannot be at your computer when you call, a printout of the screen will be helpful.

[Error codes](#)

Using the main WScan window

The main WScan window is the window that appears when you first start WScan.

Using the toolbar

Whenever WScan scans system memory, diskettes, or hard disks, WScan reports the following information.

- Files that are possibly infected.
- Possibly Infected By the name of the virus infecting the associated file.
- Report of the scan results.
- Messages that provide status, warning, and error information encountered during the scan.

WScan performs a self-check when it loads to ensure the integrity of the WScan program and data files. If an error occurs, see Program fails on self-check.

Troubleshooting

Selecting items to scan / clean

Before scanning or cleaning, you must select drives, directories, or files to scan. You can scan local drives, including diskette drives, as well as network drives. You can select up to 26 items in DOS and Windows, and up to 40 items in OS/2. By default, drive C is selected automatically.

To select drives, choose **File|Select Items to Scan** or click the **Select** icon. The Select Items to Scan dialog box appears.

[Configuring WScan](#)

Displaying the WScan Notebook

You can fine-tune the way WScan scans your system to increase system security, reduce scanning time, and perform specific tasks. For example, you can delete infected files automatically or move them to a quarantine directory, generate a report of scan results, use CRC integrity checking to detect unknown viruses, and so on. You select these options in the WScan Notebook, which contains several pages of scan options.

To display the WScan Notebook, click the Settings icon OR choose any option from the Settings menu.

Selecting Control options

To change control settings, choose **Settings|Controls** or click the **Configure** icon to display the Controls page of the WScan Notebook. Choose any of these options.

<u>Option</u>	Description
<u>Executables Only</u>	Scan executable files only (COM, EXE, SYS, BIN, OVL, DLL).
<u>Subdirectories</u>	Scan subdirectories inside selected directories.
<u>Compressed Executables</u>	Scan compressed executable files created by the LZEXE or PKLITE utilities.
<u>Turbo Mode</u>	Speed up scanning; may detect fewer viruses.
<u>Performance Packages</u>	Select settings (see below).
<u>Default</u>	Select default control settings automatically.
<u>Optimal</u>	Select optimal control settings automatically.
<u>Maximum</u>	Select maximum control settings automatically.

See also

[Configuring WScan](#)

Selecting Action options

To change action settings, choose **Settings|Actions** or click the **Actions** tab to display the Actions page of the WScan Notebook. Choose any of these options.

Option	Description
<u>Clean Infection (File, Boot Sector, MBR)</u>	Clean up infections in boot sector and files when possible.
<u>Delete Infected File</u>	Overwrite and delete infected files.
<u>Move Infected File to Directory</u>	Move infected files to a quarantine directory.
<u>Enter a Directory Name</u>	Enter a quarantine directory.
<u>Browse</u>	Select a quarantine directory.

See also

[Cleaning your system](#)

[Configuring WScan](#)

Selecting Report options

About reports

To change report settings, choose **Settings|Reports** or click the Reports tab to display the Reports page of the WScan Notebook. Choose any of these options.

<u>Option</u>	Description
<u>Report File Name</u>	Type a report file name.
<u>Browse</u>	Select a report file from a list.
<u>Append to Report File</u>	Append report information to an existing report file.
<u>Include Corrupted Files</u>	Include corrupted files in the report.
<u>Include Modified Files</u>	Include validated files that have been modified in the report.
<u>Include System Errors</u>	Include system errors in the report.
<u>Maintain Activity Log</u>	Keep track of scan activities in a log file.
<u>Keep Last <i>n</i> Events</u>	Limit the number of saved scans to <i>n</i> .

See also

[Printing reports](#)

Selecting Validation options

To change validation settings, choose **Settings|Reports** or click the Reports tab to display the Reports page of the WScan Notebook. Choose any of these options.

<u>Option</u>	Description
<u>Append Codes to Files</u>	Store recovery/validation codes in validated program files.
<u>Save Codes to External File</u>	Store recovery/validation codes in an external validation database file.
<u>Database File</u>	Specify a validation database file.
<u>Browse</u>	Select a validation database file from a list.
<u>Add Codes</u>	Add validation codes.
<u>Check Codes</u>	Check existing validation codes.
<u>Remove Codes</u>	Remove existing validation codes.

Note If you install new software on your system, including a new DOS version, you will need to update validation codes to include these new files. The fastest way to do this is to first select Remove Codes and scan your system, then select Add Codes and scan your system again.

See also

Cleaning your system

Configuring WScan

Using validation / recovery codes

Changing the Exception List

If you set up validation codes on the [Exceptions page](#) of the [WScan Notebook](#), subsequent scans can detect changes in validated files. This can generate false alarms if the executable files are self-modifying or self-checking (most programs that do this will tell you to turn off your anti-virus software before running them). Therefore, when using validation codes, specify an exception list to identify such files and exclude them from the validation. The exception list is an ASCII or DOS text file.

Command line equivalent is `/EXCLUDE {filename}`.

To change the exception list, choose **Settings|Exceptions** or click the **Exceptions** tab to display the Exceptions page of the [WScan Notebook](#). Choose any of these options.

<u>Option</u>	Description
<u>Exceptions File</u>	Type a validation exceptions file name.
<u>Browse</u>	Select a validation exceptions file.
<u>Save</u>	Save changes to the list of files to exclude.
<u>Files to Exclude from Validation</u>	Display or change the list of files to exclude from validation.
<u>Add</u>	Add a file to the list of files to exclude.

See also

[Using validation / recovery codes](#)

Setting the scan schedule

You can schedule future times for WScan to scan your system automatically.

To change schedule settings, choose **Scan|Schedule** or click the **Schedule** icon to set or change prescheduled scans. Choose any of these options.

<u>Option</u>	Description
<u>Active Schedules</u>	Display a list of scheduled scans.
<u>Add</u>	Add a scheduled scan to the Schedule list.
<u>Delete</u>	Remove a scheduled scan from the Schedule list.
<u>Close</u>	Close the Scheduler dialog box.
<u>Frequency</u>	Set the scheduled scanning frequency.
<u>Date</u>	Set the scheduled day of the week or month.
<u>Time of Day</u>	Set the scheduled time of day.
<u>All Local Drives</u>	Scan all local drives.
<u>All Network Drives</u>	Scan all network drives.
<u>Select</u>	Select drives, directories, and for the scheduled scan.
<u>Options</u>	Select scanning options in the WScan Notebook for the scheduled scan.

See also

[About Scheduling](#)

[Configuring WScan](#)

About scanning

WScan can detect known, new, and unknown viruses.

Known virus detection

WScan detects known viruses by searching the system for known characteristics (sequences of code) unique to each computer virus and reporting their presence if found. For viruses that encrypt or cipher their code so that every infection is different, WScan uses detection algorithms that work by statistical analysis, heuristics, and code disassembly.

New and unknown virus detection

WScan can also check for new or unknown viruses by comparing files against previously recorded validation data. If a file has been modified, it will no longer match the validation data, and WScan will report that the file may have become infected. With certain options, cleaning can restore infected files, master boot records (MBRs), or boot sectors.

When to scan

Although VShield will monitor your software for viruses, it is wise to scan your disks when you introduce new programs or disks that may be infected.

WScan your system when you

Insert an unchecked diskette

Install or download new files

Scanning steps

Scan your system when you want to detect and identify viruses.

To scan

- 1 Select the items you want to scan. You must select at least one item to scan (by default, drive C is selected). Alternatively, load selected items from a settings file.
- 2 Select the scan settings you want.
- 3 Double-click the Scan icon or choose **Start Scan** from the Scan menu.

WScan performs the check according to the settings you have selected. You will see the names of files being scanned in the status bar, and you will see any status or warning messages in the main WScan window.

- ▶ If you find a virus

About cleaning

Basic principles to minimize damage

- Before cleaning your system, back up all of your programs and data.
Of course, this works best if you back up regularly, so that you can restore from a backup made before your system was infected. But even a backup from an infected system can be useful for restoring data because most viruses do not corrupt data. If a program no longer runs after being cleaned, replace it from the original disk or from a virus-free backup.
- When disinfecting an infected system, it is important to start from a sterile field.
- Restart your computer from a clean, write-protected diskette.

Background

Although cleaning removes many viruses and restores normal operation, viruses can be harmful and insidious, and no anti-virus program can undo all their damage. Between 10% and 20% of all viruses actually corrupt the files they infect. If the file is infected with an uncommon virus that WScan cannot restore, WScan notifies you and identifies the filename. Write down this filename so that you can restore it from a backup diskette or tape.

If you use both the **Clean Infection (File, Boot Sector, MBR)** and the **Delete Infected File** options, WScan will first attempt to disinfect an infected file and, if the file is damaged beyond repair, delete the infected file. Deleted files are not recoverable except from backups.

Some viruses damage or overwrite program files or overlay files. Removing the virus can truncate the file or otherwise render it inoperable. Others, like the common virus Stoned, infect the master boot record (MBR). On systems partitioned with programs other than DOS (such as Disk Manager and SpeedStor), removing the virus can cause loss of the master boot record (MBR) and all data on the disk.

We strongly recommend that you get experienced help in dealing with viruses if you are unfamiliar with anti-virus software and methods. This is especially true for critical viruses, master boot record (MBR), and boot sector infections because improper removal of these viruses can result in the loss of all data and use of the infected disks.

Note To use WScan to clean up infected files, the CLEAN.DAT file *must* be present in the WScan subdirectory. If you do not have the CLEAN.DAT file, first verify whether you should contact your system administrator or information systems staff directly for virus clean-up. Otherwise, you can contact McAfee.

When to clean

Clean when you find or suspect a virus infection in your system.

Cleaning your system

To clean

- 1 Select the items you want to clean. You must select at least one item to scan (by default, drive C is selected).
- 2 Select the clean settings you want.
- 3 Select Clean Infection (File, Boot Sector, MBR) on the Actions page of the WScan Notebook.
- 4 Click the Scan icon, or choose **Scan|Start Scan**.

WScan performs the check according to the settings you have selected. You will see the names of files being scanned in the status bar, and you will see any status or warning messages in the main WScan window.

WScan reports the results of its attempt to remove the virus from each infected file. If a file has several infections, it will report on each.

If viruses were safely removed, rescan and check diskettes. If WScan has successfully removed all the viruses, turn your computer off again and restart from the system disk. Scan your hard disks again to make sure they are virus-free. If you suspect that your system was infected from a diskette, run WScan from your hard disk to examine and disinfect the diskettes you use.

- ▶ If a virus cannot be removed

If a virus cannot be removed

If WScan cannot remove a virus, a message appears:

Virus cannot be safely removed from this file.

Write down the filename or generate a report so that you know what to restore from backups.

About validation / recovery codes

If your environment is highly vulnerable to viruses, or you require unusual security against them, you can use WScans validation and recovery options. WScan checks for new or unknown viruses by comparing files against previously recorded validation data. If a file has been modified, it no longer matches the validation data, and WScan reports that the file may have become infected.

WScan has two levels of validation, which are stored in two separate ways:

- Storing codes in a single Save Codes to External File WScan can store the enhanced code in a separate recovery file, which can be stored off-line (for example, on a diskette) for recovery purposes. This is the preferred method because it stores the data for files, the boot sector, and the master boot record (MBR) of a disk in the recovery file.
- Storing codes in validated files WScan can append a simple 10-byte validation code to .COM and .EXE files. This method applies only to the files you specified. It does not store data for the boot sector and master boot record (MBR).

Once the validation / recovery codes are stored, WScan can check them to detect changes to the files. In addition, VShield can use the /CV and /CF options to detect changes as well. More importantly, if you have stored the recovery information with /AF, WScan can use it to restore infected files, master boot records (MBRs), and boot sectors.

All of these options require continuing effort to store and maintain the codes. For example, if you install new programs or upgrade old ones, you should use the Remove option to remove all the codes, then the Add option to restore them.

If you install new software, or upgrade your DOS version, remember to update your recovery file.

See also

[Using validation / recovery codes](#)

Storing codes in an external data file

Storing codes in a single file is PREFERRED to Storing codes in all files because

- You can store the recovery file off-line (on your clean anti-viral startup diskette, for example, or on a network drive or tape drive). You can also access it on demand to check for, and recover from, infection by unknown viruses.
- It keeps self-checking files (usually copy-protected programs) from reporting that they have been tampered with.
- You do not need an exception list. However, it is important that you run WScan with the /RF option on individual self-modifying files, such as Lotus 1-2-3, to remove the validation codes for those programs from the validation file.

Command line equivalents are /AF, /CF, and /RF.

See also

[Using validation / recovery codes](#)

[About validation / recovery codes](#)

Storing codes in validated files

Storing codes in all files is useful primarily for companies that distribute software to their customers or employees, and want to incorporate an additional level of virus protection.

The preferred method is storing codes in a single file.

Command line equivalents are /AV, /CV, and /RV.

See also

Using validation / recovery codes

About validation / recovery codes

About reports

You can create a report that describes the results of your scan. A report includes information about the items scanned, infections found, infections cleaned, and optional details about corrupted files, modified files, and system errors.

See also

[Selecting Report Options](#)

About scheduling

You can schedule WScan to automatically scan at a future date and time. Thereafter, WScan runs the scan at the scheduled time *if* the workstation is running and WScan is loaded, even if you are using another application at the time.

In this way, you can scan your system unattended and ensure that scanning occurs on a regular basis. For each scheduled scan, you can specify when to scan, what to scan, and which scan options to use. WScan saves the information for each scheduled scan in a separate .INI file.

See also

[Selecting Scheduling Options](#)

Interacting with your network

Many personal computers are interconnected through a local area network (LAN). WScan is highly compatible with most networks. Here are some ways of using the WScan software with your network:

Run WScan on network drives

When WScan runs from a workstation (PC) on the network, it checks network drives for viruses just as it does local drives. For convenience, if the Network Drives check box on the Scheduler dialog box is selected, WScan scans all network drives to which the workstation is connected.

Use VShield and ChkVshld

By activating VShield as part of every workstation's AUTOEXEC.BAT file, you can prevent the workstations from introducing viruses into the network. Network administrators can ensure that VShield is active on each workstation by running ChkVshld as part of the network login script, before actual login.

Use NetShield

McAfee, Inc.'s NetShield program provides continuous virus protection on a NetWare server. NetWare network administrators can use it to check for both known and unknown viruses and to monitor all network activities.

[Develop a security program](#)

See also

[Tips](#)

Developing a security program

WScan has been shown to be an effective virus-prevention tool that can be of significant value when used in a conscientiously applied program of network hygiene.

WScan is only one important element. A comprehensive computing security program includes a variety of safety measures, such as regular backups, meaningful password protection, user training, and administrator awareness. Even with WScan, some viruses--along with theft or fire--can render a disk unrecoverable without a recent backup.

If you are a network administrator, we urge you to implement a security program to safeguard your organizations data and productivity. If you are a network user, please support and comply with such a program.

[Tips](#)

Backing up your system

Some viruses may leave certain disks or files unusable even after they are cleaned up. Between 10% and 20% of all infections involve files that are corrupted beyond repair.

To increase your chance of recovery, copy all the files on all of your hard disks onto clean diskettes or a backup tape. You can use a commercial backup program, or the one included with DOS or OS/2. Scan the program disk first to make sure that the backup program itself is not infected. Do not run the backup program if it is infected.

Although some of the backed-up files may be infected, it is better to have current copies than not. However, do not overwrite previous backup disks or tapes, which may not be infected.

Tips

General abnormalities

Using WScan with other anti-virus software

When you run more than one anti-virus program, you risk strange results and false alarms. For example, some anti-virus programs store their virus signature strings unprotected in memory. Running a WScan program may detect them.

TSR conflicts

Some terminate-and-stay-resident (TSR) software may conflict with WScan programs, especially VShield (which is itself a TSR). To check whether this is the problem, comment out the other TSR files in your AUTOEXEC.BAT file and restart your system. If the errors disappear, the TSR conflict caused them.

Slow disk access, program locks

Running VShield will slow your system slightly, especially if you use either the /ANYACCESS or /SWAP options. If you experience very slow disk access, or if programs lock or freeze while using Windows 3.1, you may be using a disk cache program that interferes with program operation, or you may need to increase the number of BUFFERS in your CONFIG.SYS file.

See also

[Troubleshooting](#)

False alarms

Due to the nature of anti-virus software, there is a possibility that WScan may report a virus in a file that is not infected. This can be more likely if you are using more than one brand of virus protection software, especially if the virus is reported in memory. WScan may also incorrectly report a virus in the boot sector or master boot record of certain copy-protected diskettes.

If WScan reports a virus infection that you suspect may be in error, [contact McAfee](#).

You can upload the file to our [BBS](#).

See also

[Troubleshooting](#)

Virus in memory

If you find a virus in memory, TURN OFF YOUR MACHINE, then run the Scan command line program from a clean start-up diskette. DO NOT use WScan to remove a virus that is resident in memory.

See also

[Troubleshooting](#)

Program fails on self-check

WScan performs a self-check when it runs. If WScan has been modified in any way, a warning appears in the Message window. If you choose to continue, WScan can still check for viruses but may spread the infection. Therefore, if WScan reports that it has been damaged, we recommend that you quit, then run the command line Scan program from a clean start-up diskette before continuing.

See also

[Troubleshooting](#)

Obtaining new software versions

As a WScan licensee, you may download new versions from the McAfee BBS without charge for one year from your date of purchase.

You may also use your own communications software to download new versions from the McAfee bulletin board, CompuServe, or the Internet. See Chapter 1, *Welcome to WScan*, and Appendix A, *Retrieving McAfee programs with your own communications software*, in the *Using VirusScan* documentation, for more information.

New versions of McAfee software are stored in compressed form to reduce transmission time. You can download the PKUNZIP utility to decompress files yourself.

Always download and decompress the files in a separate directory from your current files. That way, if you discover a problem with the new files, you will still have the old ones.

[Upgrading](#)

Validating McAfee software

The WScan program in your WScan package is supplied on a write-protected diskette (notchless) that should be secure from infection.

If your new copy of WScan differs from the validation data, it may have been damaged. Do not use it, and obtain a clean copy of WScan from a known source.

defined. When you download a program file from any source other than the McAfee BBS or other McAfee service, it is important to verify that it is authentic, unaltered, and uninfected. McAfee anti-virus software includes a program called Validate that helps you do this. When you receive a new version of WScan, run Validate on all of the program files.

To do this for WScan, start from the system prompt (C> or [C:\]).

- 1 Navigate to the directory to which you have downloaded the files. For example, if you have stored the files in C:\MCAFFEE\DOWNLOAD\VIRUSCAN:

```
C> c:
```

```
C> cd \mcafee\download\viruscan
```

- 2 Type the following command

```
DOS or Windows C> validate SCAN.EXE
```

- 3 Compare the results with the information in the PACKING.LST file or on-line documentation file for the program you validated. If the validation results match what is in the file, it is highly unlikely that the program has been modified.

[Upgrading](#)

Updating your clean start-up diskette

Once you have validated the new version, copy it into your C:\MCAFEE directory. In addition, copy the WScan program onto your clean start-up diskette. Here is a way to do this from the command prompt.

Note any changes you have made to default options because you may want to select and save them again. Start from the system prompt (C> or [C:\]).

- 1 Navigate to the directory to which you have retrieved the files, such as C:\DOWNLOAD\VIRUSCAN:

```
C> c:
```

```
C> cd \mcafee\download\viruscan
```

- 2 Copy the contents of the directory to C:\MCAFEE

```
C> copy *.* c:\mcafee
```

- 3 Temporarily remove write-protection from your clean start-up diskette and insert it in drive A.

For a 3.5" diskette, slide its corner tab so that the square hole is *closed*.

For a 5.25" diskette, remove the tab from its corner notch.

- 4 Copy the WScan program to the diskette.

```
DOS or Windows C> copy SCAN.EXE a:
```

- 5 Remove the diskette from the drive and ***write-protect it*** again.

About the WScan Notebook

The [WScan Notebook](#) contains pages of WScan options. Before you scan, select the options you want.

See also

[Configuring WScan](#)

[Displaying the WScan Notebook](#)

Inserting an unchecked diskette

Scan whenever you insert an unchecked diskette in a diskette drive.

Every time you insert a new diskette in your drive, run WScan on it before executing, installing, or copying its files. In fact, we recommend doing this now with all the diskettes you normally use.

See also

[When to scan](#)

Installing or downloading new files

Every time you install new software on your hard drive, or download executable files from a network server, bulletin board, or on-line service, run WScan on that drive BEFORE executing the files.

If you install any new software or programs on your system, including a new version of DOS, and are running WScan or VShield with the validation options, you need to add validation codes to the new files. The quickest way to update the validation codes is to remove all validation codes from the hard disk and then add them back.

[When to scan](#)

[Using validation codes](#)

Using profiles

A *profile* is a simplified way to scan your system using scan options stored in a profile load file. Using profiles automates repetitive scanning tasks and makes it easier to scan your system

Before using profiles, they must be defined in the WSCAN.INI file. If no profiles are available, you (or your system administrator or information systems staff) must create them, then reload WScan. For instructions, see Setting up profiles.

See also

Selecting a profile

Setting up profiles

Formatting a profile file

Setting up profiles

Before you can select profiles from the Run Profile dialog box, the profiles must be defined in the WSCAN.INI file. Once defined, you must restart WScan for your changes to take effect.

Contact your system administrator or information services staff before attempting this procedure yourself. They might want to perform this procedure for you.

To set up or modify a profile, you need to use a text editor that can read and save WSCAN.INI as an ASCII text file. You also need to create the scan load file you want to use for each profile, as described in the discussion of the /LOAD option in Chapter 4 of the *VirusScan User's Guide*.

Here's an example of the settings for the header variables in the WSCAN.INI file.

```
Header1=Profile Engine v1.0  
Header2=Select a profile to run, please
```

Here's an example of the settings for one of the buttons in the WSCAN.INI file.

```
[Profile1]  
Label=Hard Disk  
Description=Scan disk C:  
File=c:\mcafee\profile1.prf
```

- `[Profile1]` begins the section for the first button (the next button is *Profile2*, and so on).
- `Label` is the short word or phrase that appears in the button.
- `Description` is the text that provides additional information about the profile and appears to the right of the button.
- `File` identifies the name and path of the profile file. If WScan cannot locate the specified file, the button is dimmed (unavailable).

You can specify these settings for up to four profiles.

See also

[Using profiles](#)

[Selecting a profile](#)

[Formatting a profile file](#)

Formatting a profile file

A setting file is an ASCII text file. Use a text editor to create the file. You can put all Scan command line options on the same command line or put each option (with its parameter) on its own line, separated by a hard carriage return and line feed, as shown in the following examples.

Sample load file with all options on the same command line:

```
m: /report a:infectn.rpt /rptcor /rpterr
```

Sample profile file with each option on a separate command line:

```
m:  
/report a:infectn.rpt  
/rptcor  
/rpterr
```

See also

[Using profiles](#)

[Selecting a profile](#)

[Setting up profiles](#)

Using settings files

You can save the scan settings and the selected items in a settings (.INI) file. That way, you dont need to select scanning options and items individually every time you want to scan--you simply load the settings file.

You can save default scan settings in WSCAN.INI (WScan reads this file and uses these settings when it loads), or you can save them in a file with a different name.

Selecting a profile overrides the current scan settings youve loaded for the duration of the profile scan.

See also

[Saving scan settings](#)

[Loading scan settings](#)

Using the activity log

The *activity log* keeps track of the dates and times you scan your system, as well as associated messages regarding the items scanned and infections found. It provides an audit trail that you can use to verify regular scanning or, if you encounter an infection, to determine the last time the system was scanned for viruses and which items were found to be infected.

To update the activity log with each scan, the Maintain Activity Log check box must be selected on the Reports page of the WScan Notebook.

To view the activity log, choose Scan|Activity Log or click the Activity Log icon. The Activity Log dialog box appears.

See also

[Maintaining an activity log](#)

[Setting the number of events stored in the activity log](#)

[Specifying a different log file name](#)

[Viewing the activity log](#)

[Viewing activity log details](#)

[Printing the activity log](#)

Specifying a different log file name

The default file name for the activity log is WSCAN.LOG. To specify a different log file name or path, use an ASCII text editor to change the LogFile variable in the [Activity Log] section of the WSCAN.INI file, as shown in the following example.

```
[Activity Log]  
LogFile=c:\mcafee\logfile\myscan.log
```

Using the Toolbar

The toolbar on the main WScan window contains icons that you can click with a mouse.

[Activity
Log]

Displaying infected files

The **File** list on the main WScan window contains a list of files that may be infected. The Infection list contains the name of the virus that may have infected the file.

Displaying the virus causing the infection

The **Possibly Infected By** list on the main WScan window contains the name of a virus that may have infected the associated file in the File list.

Displaying report summary information

The **Report** summary area on the main WScan window contains a summary of the results of a scan.

It shows the number of files, boot sectors, and master boot records that were scanned, analyzed, and, if applicable, infected.

Clearing log messages

Choose the **Clear** button to clear log messages that appear in the Messages list.

A dialog box asks you to confirm that you want to clear messages. Choose **Yes** to clear them, or choose **No** to keep them.

Display scan output messages

The **Messages** list on the main WScan window displays messages describing what WScan found while scanning, including infections, corruptions, system errors, and a summary of results.

Moving to the next page in the WScan Notebook

Choose the >> (**Next**) button to move to the next page in the WScan Notebook.

This button is dimmed if you are on the last page in the Notebook.

Moving to the previous page in the WScan Notebook

Choose the << (**Previous**) button to move to the previous page in the WScan Notebook.

This button is dimmed if you are on the first page in the Notebook.

Closing the WScan Notebook

Choose the **Close** button on any page to close the WScan Notebook and return to the main WScan window.

Scanning executable files only

Select the **Executables Only** check box on the Controls page of the WScan Notebook to scan files with standard extensions.

Executables Only reduces scan time by checking only files with standard extensions: EXE, .COM, .SYS, .BIN, .OVL, or .DLL. If this option is not selected, WScan checks all files on the selected drives and directories, which increases scan time. Do not use this option if you have found a virus or suspect one.

Command line equivalent is /ALL.

Scanning subdirectories

Select the **Subdirectories** check box on the Controls page of the WScan Notebook to scan subdirectories.

Subdirectories tells WScan to check files in the subdirectories of selected directories. If this option is not selected, WScan ignores subdirectories. You do not need to select this option if you are scanning an entire drive.

Command line equivalent is /SUB.

Scanning compressed executable files

Select the **Compressed Executables** check box on the Controls page of the WScan Notebook to scan compressed executable files.

Compressed Executables tells WScan to check inside executable, or self-decompressing, files that have been compressed using the LZEXE or PKLITE file compression programs. If selected, WScan decompresses each file in memory and checks for viruses signatures. If this option is not selected, WScan does not check *inside* compressed files for viruses, although it can check for modifications if the validation options are used.

Command line equivalent, if this option is not selected, is /NOCOMP

Using the turbo mode

Select the **Turbo Mode** check box on the Controls page of the WScan Notebook to use WScan's Turbo mode.

Turbo reduces scan time by examining a smaller portion of each file. This takes less time but might miss some infections. Therefore, do not use this option if you have found a virus or suspect one.

Command line equivalent is /FAST.

Choosing default settings

Choose the **Default** button to select program default settings on the Controls page of the WScan Notebook.

Choosing this button overrides any settings you may have selected individually or by choosing other Performance Packages, such as the Optimal or Maximum buttons.

Choosing optimal settings

Choose the **Optimal** button to select optimal settings on the Controls page of the WScan Notebook.

Choosing this button overrides any settings you may have selected individually or by choosing other Performance Packages, such as the Default or Maximum buttons.

Choosing maximum settings

Choose the **Maximum** button to select the maximum settings on the Controls page of the WScan Notebook.

Choosing this button overrides any settings you may have selected individually or by choosing other Performance Packages, such as the Default or Optimal buttons.

Cleaning infected files

Select the **Clean Infection (File, Boot Sector, MBR)** check box on the [Actions page](#) of the [WScan Notebook](#) to clean virus infected files.

Cleaning tells WScan to attempt to restore the boot sector and any infected files. Between 10% and 20% of all viruses are not removable; they damage the infected file beyond repair. If the infected file resides on a network drive, you must have rights to change files on that drive. If WScan cannot restore a file, you will see a message that identifies the name of the unrecoverable file. If **Clean Infection (File, Boot Sector, MBR)** is not selected, WScan merely reports the infection in the [main WScan window](#).

Note To select this option, the CLEAN.DAT file must reside in the WScan directory. If the file does not exist, contact your system administrator or information systems staff to determine whether they will clean your system instead. Otherwise, [contact McAfee](#).

■ We recommend selecting both **Clean Infection (File, Boot Sector, MBR)** and [Delete Infected File](#) so that WScan attempts to restore the virus first, then deletes the file only if it cannot be recovered. In addition, **Clean Infection (File, Boot Sector, MBR)** can remove master boot record (MBR) and boot sector viruses, but **Delete Infected File** alone cannot.

■ Alternatively, we recommend selecting both **Clean Infection (File, Boot Sector, MBR)** and [Move Infected File to Directory](#) so that WScan attempts to restore the virus first, then moves it to the quarantine directory only if it cannot be recovered. In addition, **Clean Infection (File, Boot Sector, MBR)** can remove master boot record (MBR) and boot sector viruses, but **Move Infected File to Directory** alone cannot.

We also recommend that you get help to deal with a virus if you are unfamiliar with anti-virus software. This is especially true for "critical" viruses and master boot record / boot sector infections, because improper removal can result in lost data or damaged disks. See [Contacting McAfee](#).

[Command line](#) equivalent is /CLEAN.

Deleting infected files

Select the **Delete Infected File** check box on the [Actions page](#) of the [WScan Notebook](#) to delete virus infected files.

Delete Infected File tells WScan to delete infected files automatically when found. Between 10% and 20% of all viruses are not removable; they damage the infected file beyond repair. Erased files cannot be recovered, so consider [generating a report](#) so that you know which files to restore from backups.

Note If the infected file resides on a network drive, you must be able to delete files on that drive.

We recommend selecting both **Delete Infected File** and [Clean Infection \(File, Boot Sector, MBR\)](#) so that WScan attempts to restore the virus first, then deletes the file only if it cannot be recovered. In addition, **Clean Infection (File, Boot Sector, MBR)** can remove master boot record (MBR) and boot sector viruses, but Delete Infected File alone cannot.

We also recommend that you get help to deal with a virus if you are unfamiliar with anti-virus software. This is especially true for "critical" viruses and master boot record / boot sector infections, because improper removal can result in lost data or damaged disks. See [Contacting McAfee](#).

[Command line](#) equivalent is /DEL.

Moving infected files to a quarantine directory

Select the **Move Infected File to Directory** check box on the [Actions page](#) of the [WScan Notebook](#) to move virus infected files to a quarantine directory.

If selected, you must type the [path](#) of the quarantine directory, or choose the [Browse](#) button to select one from a list.

We recommend selecting both **Move Infected File** and [Clean Infection \(File, Boot Sector, MBR\)](#) so that WScan attempts to restore the virus first, then moves the file to the quarantine directory only if it cannot be recovered. In addition, **Clean Infection (File, Boot Sector, MBR)** can remove master boot record (MBR) and boot sector viruses, but **Move Infected File** alone cannot.

We also recommend that you get help to deal with a virus if you are unfamiliar with anti-virus software. This is especially true for "critical" viruses and master boot record / boot sector infections, because improper removal can result in lost data or damaged disks. See [Contacting McAfee](#).

[Command line](#) equivalent is /MOVE.

Specifying the path of the quarantine directory

Type the path name of the quarantine directory (such as `c:\mcafee\quarntin`) in the text box, or choose Browse to select one.

Note To use this option, the Move Infected File to Directory check box must be selected.

Selecting a quarantine directory

Choose the **Browse** button on the Actions page of the WScan Notebook to select a quarantine directory from a directory list. The directory you select appears in the Quarantine Directory text box. Alternatively, you can type the path of the directory in the text box.

Note To use this option, the Move Infected File to Directory check box must be selected.

Selecting a quarantine directory in the Directory Selection dialog box

Use the Directory Selection dialog box to select a quarantine directory you want to use for infected files.

Select the Drive, if necessary, then select the Directory you want to use.

When finished, choose OK to close the dialog box and save the selection you've made, or choose Cancel to abandon your selection.

This dialog box appears when you choose Browse to select a Quarantine directory on the Actions page of the WScan Notebook.

Closing the Directory Selection dialog box

Choose **OK** on the Directory Selection dialog box to save the quarantine directory you've selected and close the dialog box.

Canceling and closing the Directory Selection dialog box

Choose **Cancel** on the Directory Selection dialog box to abandon the quarantine directory you've selected and close the dialog box.

Selecting a drive for the quarantine directory

Select a drive from the **Drives** list on the Directory Selection dialog box that contains the quarantine directory you want to use for infected files.

Selecting a quarantine directory

After you've selected a drive, select a directory from the **Directory** list on the Directory Selection dialog box for the quarantine directory you want to use for infected files.

Specifying the name of a report file

In the **Report File** Name text box on the [Reports page](#), type the name and path of the report file you want to use or create (such as `c:\mcafee\myscan.rpt`) in this text box, or choose [Browse](#) to select one from a list of files.

Command line equivalent is /REPORT.

Selecting a report file

Choose the **Browse** button on the Reports page of the WScan Notebook to select a report file from a list of files. The file name you select appears in the Report File Name text box.

Command line equivalent is /REPORT.

Appending information to the report file

Select the **Append to Report File** check box on the Reports page of the WScan Notebook to add scan log information to the end of the specified report file.

Note If this check box is not selected, WScan overwrites the specified report file, if it exists.

Command line equivalent is /APPEND.

Including messages about corrupted files in the report file

Select the **Include Corrupted Files** check box on the Reports page of the WScan Notebook to include information about corrupted files in the specified report file.

If this check box is not selected, WScan excludes corruptions from the report file.

Command line equivalent is /RPTCOR.

Including warnings about modified files in the report file

Select the **Include Modified Files** check box on the Reports page of the WScan Notebook to include in the specified report file information about files that have been modified.

If this check box is not selected, WScan excludes warnings about modified files from the report file.

Command line equivalent is /RPTMOD.

Including system errors in the report file

Select the **Include System Errors** check box on the Reports page of the WScan Notebook to include information about system errors in the specified report file.

If this check box is not selected, WScan excludes errors from the report file.

Command line equivalent is /RPTERR.

Maintaining an activity log

Select the **Maintain Activity Log** check box on the Reports page of the WScan Notebook to keep information about each scan in a log file.

If selected, WScan saves the time and date at which a scan is run, as well as any results of the scan, by updating or creating an activity log file (by default, `SCAN.LOG` in the current directory).

If this check box is not selected, WScan does not maintain an activity log.

Command line equivalent is `/LOG`.

Setting the number of events stored in the activity log

Select the **Keep Last *n* Events** check box on the Reports page of the WScan Notebook to set the number of events stored in the activity log file.

The Maintain Activity Log check box must be selected for this option to have any effect.

Storing validation / recovery codes in program files

Select the **Append Codes to Files** check box on the Validation page of the WScan Notebook to add, check, or remove validation / recovery codes in standard executable files, adding about 98 bytes to each file validated.

This method validates files but not the master boot record (MBR) or boot sector of a disk. If the executable files reside on a network disk, you must have sufficient rights to update them.

You must also select Add codes, Check codes, or Remove codes.

Note You can select either Append Codes to Files or Save Codes to External File, but you cannot select both in the same scan.

See also

Using validation / recovery codes

Storing validation / recovery codes in an external file

Select the **Save Codes to External File** check box on the Validation page of the WScan Notebook to add, check, or remove validation / recovery codes in an external file you specify.

This method, which is the preferred method, validates files, the master boot record (MBR), and boot sector of a disk. If the database file resides on a network disk, you must have sufficient rights to create and delete it.

If selected, you must type the file name of the validation file, or choose Browse to select one from a list.

You must also select Add codes, Check codes, or Remove codes.

Note You can select either Append Codes to Files or Save Codes to External File, but you cannot select both in the same scan.

See also

Using validation / recovery codes

Specifying the name of an external validation file

Type the name and path of the validation file you want to use or create (such as `c:\mcafee\valcodes.sav`) in this text box, or choose [Browse](#) to select one from a list of files.

Note To use this option, the [Save Codes to External File](#) check box must be selected.

See also

[Using validation / recovery codes](#)

[Actions page](#)

Selecting an external validation file

Choose the **Browse** button on the Validation page of the WScan Notebook to select a validation file from a list of files. The file you select appears in the Save Codes to External File text box.

Note To use this option, the Save Codes to External File check box must be selected.

See also

Using validation / recovery codes

Adding validation / recovery codes

Select the **Add Codes** radio button on the Validation page of the WScan Notebook to add validation / recovery codes to program files or to an external database file.

Note For this option to work, either the Append Codes to Files or Save Codes to External File check boxes must be selected.

Command line equivalents are /AF for an external file and /AV for binary files.

See also

Using validation / recovery codes

Checking validation / recovery codes

Select the **Check Codes** radio button on the Validation page of the WScan Notebook to check validation / recovery codes that have previously been added in program files or in an external file.

Note For this option to work, either the Append Codes to Files or Save Codes to External File check boxes must be selected.

Command line equivalents are /CF for an external file and /CV for binary files.

See also

Using validation / recovery codes

Removing validation / recovery codes

Select the **Remove Codes** radio button on the [Validation page](#) of the [WScan Notebook](#) to remove validation / recovery codes that have previously been added in program files or in an external file.

Note For this option to work, either the [Append Codes to Files](#) or [Save Codes to External File](#) check boxes must be selected.

See also

[Using validation / recovery codes](#)

Adding a file to the validation exceptions list

Choose the **Add** button on the Exceptions page of the WScan Notebook to select a file to add to the current validation exceptions list.

See also

Using validation / recovery codes

Saving the validation exceptions list

Choose the **Save** button on the Exceptions page of the WScan Notebook to save the current validation exceptions list to the specified validation exceptions file.

Note This button is available only if you've changed the validation exceptions list.

See also

Using validation / recovery codes

Specifying the name of a validation exceptions file

Type the name and path of the validation exceptions file you want to use or create (such as `c:\mcafee\exceptn.vss`) in the **Exceptions File** text box, or choose Browse to select one from a list of files.

See also

[Using validation / recovery codes](#)

[Exceptions page](#)

Selecting a validation exceptions file

Choose the **Browse** button on the Exceptions page of the WScan Notebook to select a validation exceptions file from a list of files. The file you select appears in the Exceptions file text box.

See also

Using validation / recovery codes

Using the validation exceptions list

The **Files to Exclude from Validation** list on the [Exceptions page](#) of the [WScan Notebook](#) contains the names and locations of files to exclude from validation.

- **Adding.** To add a new file to the list, insert a new line by moving the insertion bar to where you want to add it and pressing *Enter*, then type the name and path of the file you want to add, such as `c:\lotus\123.com`. Alternatively, click the [Add](#) button and select the file from a list of files.
- **Changing.** To change a file entry on the list, drag the mouse to select the text you want to change, then type the replacement text.
- **Removing.** To remove a file from the list, drag the mouse to select the entire line, then press *Del* or *BackSpace*.

[Using validation / recovery codes](#)

Setting the scan frequency

On the Scheduler dialog box, select the frequency interval (Daily, Weekly, or Monthly) with which you want WScan to perform automatic scanning.

You can also set the schedule day and time.

Setting the scan date

On the Scheduler dialog box, select the date on which you want to scan.

- If the frequency is **Weekly**, select the day of the week (Sunday through Saturday).
- If the frequency is **Monthly**, select the day of the month (1 through 31).
- If the frequency is Daily, this list is unavailable.

You can also set the schedule frequency and time.

Setting the scan time of day

On the Scheduler dialog box, set the time of day at which an automatic scan will occur (midnight to 11:00 pm)

You can also set the schedule frequency and date.

Scanning local drives

Select the **Local Drives** check box on the Scheduler dialog box to scan all local drives on the workstation.

Command line equivalent is /ADL.

Scanning network drives

Select the **Network Drives** check box on the Scheduler dialog box to scan all network drives to which the workstation is currently attached.

Command line equivalent is /ADN.

Selecting items for scheduled scans

Choose the **Select** button on the Scheduler dialog box to select a drives, directories, and files to scan for the currently selected scheduled scan *ONLY*. The items you select are saved when you add the scheduled scan.

You can also choose the Options button to select settings in the WScan Notebook.

Selecting items from within the Scheduler dialog box *DOES NOT* change the scanning options currently selected for scanning in the main application.

Selecting options for scheduled scans

Choose the **Options** button on the Scheduler dialog box to display the WScan Notebook and select scanning options for the currently selected scheduled scan *ONLY*. The options you select are saved when you add the scheduled scan.

You must also choose the Select button to select drives, directories, and files to scan.

Selecting options from within the Scheduler dialog box *DOES NOT* change the scanning options currently selected for scanning in the main application.

Displaying a list of scheduled scans

This **Active** Schedules list on the Scheduler dialog box displays the scans that are scheduled for the future. Each scheduled scan resides in a separate .INI file.

Choose the Add and Delete buttons to add and remove, respectively, scheduled scans on this list.

Adding a scan to the schedule

Choose the **Add** button on the Scheduler dialog box to add a scan to the schedule.

When you add a scan, WScan saves the frequency and options you've set and items you've selected in the SCAN.INI file.

Removing a scan from the schedule

Select a scheduled scan in the schedule list, then choose the **Delete** button on the Scheduler dialog box to remove the selected scan from the schedule.

When you delete a scheduled scan, WScan removes its entry in the SCAN.INI file.

See also

[Scheduler dialog box](#)

Closing the Scheduler dialog box

Choose the **Close** button to close the Scheduler dialog box.

Viewing the activity log

The Activity Log dialog box displays the scanning events saved in the activity log file.

Item	Description
Summary of Activities	Displays the most recent scanning events.
<u>Details</u>	Displays items scanned and infections found during the selected event..
<u>Print</u>	Prints the log file.
Clear Log	Deletes the log file.

See also

[Using the activity log](#)

Viewing the activity log details

The **Activity Log - Details** dialog box displays the items scanned and viruses found during the selected event in the Activity Log dialog box.

Item	Description
Items were scanned	Displays the items scanned for the selected event.
Viruses were found	Displays the viruses found during the selected event.
<u>Print</u>	Prints the detail information in the log file.

See also

Using the activity log

Displaying the virus list

Choose **Scan|Virus List** or click the **Virus List** icon to display a list of viruses that WScan detects, identifies, and disinfects. Command line equivalent is /VIRLIST.

The virus list describes the many known viruses that WScan detects, identifies, and disinfects. It tells you whether WScan can remove the virus and provides additional information about the virus and the files it infects. The virus list information is stored in the NAMES.DAT file. It includes the following information about each virus.

Infects describes what the selected virus infects:

- Files**, if selected, indicates that the virus infects files. If the virus targets files with specific extensions or files of a specific type, the extensions appear to the right of the check box.
- Boot Sectors**, if selected, indicates that the virus infects the boot sector of a disk.
- MBR**, if selected, indicates that the virus infects the master boot record of a disk.
- Can be Cleaned**, if selected, indicates that WScan can remove the virus from infected files.

Features describes behaviors of the selected virus:

- Memory Resident**, if selected, indicates that the virus is a terminate-and-stay-resident (TSR) program that remains in memory while the computer is running.
- Encrypted**, if selected, indicates that the virus attempts to evade detection by self-encrypting.
- Polymorphic Virus**, if selected, indicates that the virus attempts to evade detection by changing its internal structure or its encryption techniques.
- Virus Size** describes the amount, in bytes, that the virus increases the size of a file it infects.

Description provides additional information about the selected virus, when available

[Searching the virus list](#)

[Printing the virus list](#)

[Closing the Virus List](#)

Listing viruses detected by WScan

This list on the Virus List dialog box displays the viruses that WScan detects, identifies, and disinfects. Scroll through this list using the scroll bars, then choose Close when finished.

Searching the virus list

To quickly find a virus in the virus list, type the first letter of the virus name, then scroll through the list using the scroll bar.

Closing the virus list

Choose **Close** to close the Virus List dialog box.

Loading WScan settings from a file

Choose **File|Load Settings** to load WScan settings from a settings file. The Load Settings dialog box appears. Select the settings file you want, then choose **OK**.

Command line equivalent is /LOAD.

See also

[Using settings files](#)

Saving settings to a file

Choose **File|Save Settings** to save the current WScan settings to a settings file. The Save Settings dialog box appears. Enter or select a file name, then choose **OK**.

See also

[Using settings files](#)

Selecting a profile

To select a profile, choose **File|Profiles** or click the **Profiles** icon. The Run Profile dialog box appears.

Choose the button of the profile you want. WScan loads the associated profile file, then scans your system using those settings.

See also

[Closing the Profiles dialog box](#)

[Using profiles](#)

[Setting up profiles](#)

[Formatting a profile file](#)

Closing the Profiles dialog box

Choose the **Close** button to close the Profiles dialog box.

Using the Selections list

The **Selections** list on the Select Items to Scan dialog box displays a list of selected drives, directories, and files to scan.

You can change this list using the Add Drive, Add Directory, Add File, and Remove buttons.

Adding a file to the Selections list

Select a file you want to add in the **Files** list on the Select Items to Scan dialog box, then choose the Add File button to add it to the Selections list.

Alternatively, you can drag a file from the right window of the Windows File Manager to the WScan window.

Adding a directory to the Selections list

Select a drive you want to add in the **Directories** list on the Select Items to Scan dialog box, then choose the **Add Directory** button to add it to the Selections list.

To scan subdirectories of a selected directory, you must select the Subdirectories check box on the Controls page of the WScan Notebook.

Alternatively, you can drag a directory from the right window of the Windows File Manager to the WScan window.

Adding a drive to the Selections list

Select a drive you want to add in the **Drives** list on the Select Items to Scan dialog box, then choose the **Add Drive** button to add it to the Selections list.

If you select a drive, its subdirectories are scanned automatically.

Closing the Select Items to Scan dialog box

Choose the **OK** button to save your selections and close the Select Items to Scan dialog box.

Removing an item in the Selections list

Select an item from the Selections list on the Select Items to Scan dialog box, then choose the **Remove** button to remove it from the list.

See also

Select Items to Scan dialog box

Displaying WScan version information

Choose **Help|About WScan** to display information about the version of WScan you are running.

Getting help on Windows help

Choose **Help|Help on Help** to get help on using the Windows help system.

You can also get help by pressing *F1* while using the Windows help system.

Searching for a Help topic

Choose **Help|Search** to search for a topic in WScan Help.

Begin scanning your system

Choose **Scan|Start Scan** or click the **Scan** icon to begin scanning based on the items and settings you have selected.

Before scanning, you must select the drives, directories, and files you want to scan. See [File|Select Items to Scan](#).

Printing the activity log

Choose the **Print** button on the Activity Log dialog box to print the activity log.

The Print dialog box appears. Select the options you want, then choose **OK**.

See also

[Using the activity log](#)

Printing the activity log details

Choose the **Print** button on the [Activity Log - Details dialog box](#) to print details of the activity log.

The Print dialog box appears. Select the options you want, then choose **OK**.

See also

[Using the activity log](#)

Printing the virus list

Choose the **Print** button on the Virus List dialog box to print the contents of the virus list.

The Print dialog box appears. Select the options you want, then choose **OK**.

Printing a report of scan results

Choose the **Print Reports** button on the main WScan window to print a report of scan results.

The Print dialog box appears. Select the options you want, then choose **OK**.

Setting up the printer

Choose the Setup button on the Print dialog box to set up the printer. Select the options you want, then choose **OK**.

Printing the scan log

Choose **File|Print** or click the **Print** icon to print a report of scan results.

You can also [set up the printer](#) before printing.

Setting up the printer

Choose **File|Print Setup** to select a printer, page orientation, and paper size and source before printing. Select the options you want, then choose **OK**.

Exiting WScan

Choose **File|Exit** or click the **Exit** icon to exit WScan.

If you've changed settings, WScan asks you whether you want to save them. If you answer **Yes**, the Save Settings dialog box appears. Select the settings file you want, then choose **OK**.

AGENTS.TXT

A text file that contains the names of all McAfee authorized agents.

[Authorized Agents \(overseas only\)](#)

People or organizations authorized to provide service, sales, and support for McAfee products in more than 50 countries around the world.

See [AGENTS.TXT](#) for a complete current list of McAfee agents.

archived file

A file that has been archived using either LZEXE or PKLITE, file compression utilities.

AUTOEXEC.BAT

Batch (command) file containing DOS commands that are executed automatically when the computer is started or restarted.

backup

A safe copy of programs or data, in case the original copy is lost or damaged.

McAfee BBS

McAfee's electronic bulletin board system (BBS) at (408) 988-4004.

Our multi-line BBS is accessible 24 hours a day, 365 days a year, except for scheduled downtime and maintenance. All lines run high-performance modems operating from 1,200 bps to 14,400 bps with line settings of 8 data bits, no parity, and 1 stop bit.

boot

To start a computer. The first step is to load startup instructions from the boot ROM or boot sector of a disk.

boot ROM

A read-only memory chip that contains the coded instructions for the operating system to start the computer. Often present in portable computers, a boot ROM is not susceptible to infection (unlike the boot sector on a disk). However, it is harder to update.

boot sector

A portion of a disk that contains the coded instructions for the operating system to start the computer.

boot sector infections

Contamination of the boot sector by a virus. Particularly serious because information in the boot sector is loaded into memory first, before virus protection code can be executed. The only certain way to eliminate boot sector infections is to restart from a disk known to be uninfected, then clean up the infection.

ChkVshld

Program to check whether the VShield protection program is running in memory.

clean startup diskette

A diskette known to be uninfected, that contains the coded instructions from which the computer can be started. See Chapter 2 for instructions on preparing one.

CLEAN.DAT

A file that contains the virus recovery information that Scan uses to recover infected files.

cold boot

To start a computer from power-off state.

compressed file

A file (usually with a .ZIP extension) that has been compressed using the PKZIP file compression utility.

CompuServe technical support

We sponsor the McAfee Virus Help Forum on CompuServe. To reach it, type `GO MCAFEE` at any CompuServe prompt. A free introductory membership is available. For more information, please read the `COMPUSER.TXT` file on your disk.

CONFIG.SYS

A file that lists device drivers and other configuration parameters that are automatically loaded when the computer is started or restarted.

conventional memory

Up to 640K of main memory in which DOS executes programs.

corrupted file

A file that has been damaged. About 10% to 20% of viral infections involve viruses that damage files beyond repair.

critical virus

A virus that can cause catastrophic damage or spread an infection during a scan.

detection

Scanning memory and disks for telltale marks or changes indicating that a virus might be present.

disinfect

To eradicate a virus so that it can no longer spread or cause damage to a system.

[download](#)

To retrieve a file from a remote computer system.

ERRORLEVEL

A DOS variable that can be set by a program as it terminates to indicate an error condition. A batch (command) file can read the ERRORLEVEL and take appropriate action.

exception list

List of files to which validation codes should not be added because they are already immunized against viruses or contain self-modifying code. Scans /AV option uses the list to avoid adding codes to inappropriate files; VShields /CERTIFY option can use it to allow certain unvalidated files to be run.

executable (file)

A file containing coded instructions to be executed by the computer. Executable files include programs and overlays.

expanded memory

Memory above DOS's 640K limit of conventional memory that is accessed by memory paging. You need special software, conforming to an expanded memory specification, to take advantage of expanded memory.

extended memory

Linear memory above DOS's 640K limit of conventional memory. Often used for RAM disks and print spoolers.

false alarm

Detecting a virus when none is present.

infected file

A file contaminated by a virus.

infection

Contamination of a computer system by a virus.

[Internet support \(mcafee.com\)](#)

The latest versions of McAfees anti-virus software are available by anonymous ftp (file transfer protocol) over the Internet from the site [mcafee.com](#). If your domain resolver does not support names, use the IP# 192.187.128.1. Enter **anonymous** or **ftp** as your user ID and your own e-mail address as the password. Programs are located in the `pub/antivirus` directory. If you have questions, please send email to support@mcafee.com.

You can also find McAfees anti-virus software at the Sintel Software Repository at `Oak.Oakland.EDU` in the `pub/msdos/virus` directory and its associated mirror sites:

`wuarchive.wustl.edu` (US)

`ftp.switch.ch` (Switzerland)

`ftp.funet.fi` (Finland)

`src.doc.ic.ac` (UK)

`archie.au` (Australia)

[master boot record \(MBR\)](#)

A portion of a hard disk that contains a partition table that divides the drive into chunks, some of which may be assigned to operating systems other than DOS.

McAfee

Founded in 1989, McAfee is the leading provider of tools for productive computing for the DOS, OS/2, and Windows environments. Our anti-virus products are used by more than 16,000 corporations worldwide. Our utility products provide data security, automated version updating, and system inspection and editing. McAfee is also the pioneer and leading provider of electronically distributed software. All of McAfee's products can be downloaded from bulletin board systems and on-line services around the world.

McAfee updates the VirusScan programs every 6 - 8 weeks or more to add new virus detectors, new options, and fix reported bugs. Product support is provided by a full-time staff of virus researchers, programmers, and support professionals, and delivered directly by McAfee or our network of more than 150 authorized agent offices in more than 50 countries worldwide.

memory

A storage medium where data or program code are kept temporarily while being used by the computer. DOS supports up to 640K of conventional memory. Beyond that limit may be accessed as expanded memory, extended memory, or an upper memory block (UMB).

memory infection

Contamination of memory by a virus. The only certain way to eliminate memory infections is to restart from a disk known to be uninfected, then clean up the source of infection.

modified file

A file that has changed after validation / recovery codes have been added.

NetShield^a

A protection program like VShield that detects viruses on a NetWare server.

network

A linkage of computers so that they can communicate and share information and resources.

OS2SCAN.EXE

Scan program file for OS/2.

OS2VAL.EXE

Validate program file for OS/2.

overlay infection

Virus contamination of a file containing auxiliary program code that is loaded by the main program.

[partition table](#)

See [master boot record](#).

polymorphic virus

Virus that attempts to evade detection by changing its internal structure or its encryption techniques.

program

Software that performs a defined function on a computer. See [executable](#).

read operation

Any operation in which information is read from a disk. DOS commands that perform read operations include **dir** (directory listing), **type** (display contents of a file), and **copy** (copy files).

See also [write operation](#).

README.1ST

Text file that contains manual updates and late-breaking instructions for the current version of the program.

recovery codes

Information that Scan records about an executable file in order to recover if it is infected by a virus. See also *validation codes*.

Scan

McAfee program that detects and disinfects viruses from your system.

SCAN.EXE

Scan program file for DOS.

SCAN.DAT

Data file used by Scan to detect known viruses.

SCAN.LOG

File in which Scan records the date and time of the last scan conducted.

secure environment

A setting in which high security against virus infection is important.

security program

An organized system of safety measures and procedures, designed to protect a computing environment against loss or theft of software, data, productivity, and proprietary information.

self-modifying program

Software that deliberately changes its own program file, often to protect against viruses or illegal copying, and is therefore difficult to validate in conventional ways.

standard extensions

Filename extensions (suffixes) that signify executable files - EXE, COM, SYS, DLL, BIN, OVL - which Scan checks by default. (Note that these extensions have changed from earlier versions).

sterile field

In medicine and, by analogy, computing, a work area that is known to be infection-free. To maintain the field, foreign objects (files) brought into the field must be sterilized first.

subdirectory

Like a file folder, a location on a disk where files (and possibly other folders) are stored.

Summary window

A screen area that shows the results of a scan, including infections, warnings, and errors.

system errors

Errors that can prevent Scan from completing its job successfully. System error conditions include disk format errors (such as unformatted disks), media errors (bad sectors), file system errors (unreadable files), network errors (unable to log in), file access errors (access permission denied), device access errors (printer out of paper), and report failures.

terminate-and-stay-resident (TSR)

A program, like VShield, that remains active in memory while you run other programs.

turbo

A scanning option that is faster than normal but less comprehensive (because it checks a smaller portion of each file).

unknown virus

A virus not yet identified and listed in SCAN.DAT. VirusScan can detect unknown viruses by observing changes in files that could result from infection.

upper memory block (UMB)

Memory in the range 640Ð1024K, just above DOSs 640K limit of conventional memory.

validate

To check that a file is authentic and has not been altered. Most validation methods rely on computing a statistic based on all the data in the file, which is unlikely to remain constant if the file itself is changed.

VALIDATE.EXE

A DOS program that verifies the authenticity of McAfee software.

[validation codes](#)

Information that Scan records about an executable file in order to detect subsequent infection by a virus.
See also [recovery codes](#).

virus

A software program that attaches itself to another program in computer memory or on a disk, and spreads from one program to another. Viruses may damage data, cause the computer to crash, display messages, or lie dormant.

virus-free environment

A setting that is known to be clean and uninfected.

VShield

McAfee's terminate-and-stay-resident program that guards your system from virus infection.

VShieldCRC

A low-memory but less effective version of VShield.

warm boot

To restart (reset) a running computer, in DOS by pressing [Ctrl]-[Alt]-[Del].

write operation

Any operation in which information is recorded on a disk. Commands that perform write operations include those that save, move, and copy files. Most write operations are also read operations because the system verifies that the data have been written correctly.

See also [read operation](#).

write protection

A mechanism to protect files or disks from being changed. A 3.5 diskette may be write-protected by sliding its corner tab so that the square hole is open; a 5.25 diskette by covering its corner notch with a write-protect tab. A file may be write-protected by changing its system attributes.

WSCAN.EXE

Scan program file for Windows.
