Visible View

University of Houston

J. Glover

is to demonstrate the features of the View class, a class that provides access to PostScript, knows how to draw itself on the screen and handles events.

This program is used as a teaching aid in the NeXT Developer Camp. Its purpose

- To use the program, bring up any of the Tool panels and watch the results of your manipulations of the View's various components.
- · The Frame panel Dthe location of the View in its superview's
- · The Coordinates panelDits own coordinates space, the area in which
- vou draw.
- · The Appearance panelĐadd a grid to the View, showing its own

coordinates space.

View), make the superview transparent.

• The Statistics panelĐa readout of the values of several important instance variables of the View

coordinate space, to composite in an image as the background

(compositing is a very fast way to paint existing bitmaps into a

The Status panel gives on-going information about the events the View is receiving as well as other actions the View might be taking in response to an event.

You can mouse down in the View to test its response to events. It will beep on mouse down and display the location of the mouse in the view's coordinates on mouse up, even when you drag the mouse outside the View's frame.
