              Program History
```

1.2 Introducing TIFFView

```
              This is a utility to read, view and print
              TIFF
              ,
              MacPaint
              ,
```

```
              GIF
               &

              IFF
              ,
              JPEG
               or any image you have a
              DataType
               for, and to write
them back as
              TIFF
              ,
              JPEG
               or
              IFF
               files.
```

   Starting from version 1.11 TIFFView requires at least 2.04.
To get the most out of it you must have an Amiga with the AGA chipset. Then
you can open your images at 8-Bit Color or Gray!

   The name TIFFView did cover the functionality of the first releases
but since then other file types where added, therefor TIFFView should get a
new name and one of the next releases may get another name.

1.3 TIFF Files

   TIFF Files (Tag Image File Format) are files commonly used in the
   graphic computer world (Mac, Sun, NeXT, IBM)

   TIFFView is compatible with the 6.0 specs of TIFF.

   supported TIFF:
    -multiple image TIFF
    -1,2,3,4,5,6,7,8,24,32 Bit
    -Line-art, gray, palette images, 24 bit color RGB, 32 Bit color CMYK.

1.4 MacPaint Files

   MacPaint Files are that old files used on Macintosh. I included this
   format because some clip-art libraries still use this format...

1.5 GIF Files

   GIF Files (Graphics Interchange Format(c)) are files that are commonly
   used in the BBS and IBM World it is however limited to 256 colors.

   supported GIF: GIF87a & GIF89a

```
-multiple image GIF files
-1,2,3,4,5,6,7,8 Bit interlaced & non interlaced files
-Line-art, gray, palette images.
```

```
The Graphics Interchange Format(c) is the Copyright property of
CompuServe Incorporated.
GIF(sm) is a Service Mark property of CompuServe Incorporated.
```

1.6 IFF Files

IFF Files (Interchange File Format) are files that are commonly used in
the Amiga World.

supported IFF:
 -1,2,3,4,5,6,7,8 Bit
 -Line-art, gray, palette images.

1.7 JPEG Files

JPEG (pronounced "jay-peg") is a standardized compression method for
full-color and gray-scale images. JPEG is designed to handle
"real-world" scenes, for example scanned photographs. Cartoons, line
drawings, and other non-realistic images are not JPEG's strong suit;
on that sort of material you may get poor image quality and/or little
compression.

JPEG is lossy, meaning that the output image is not necessarily
identical to the input image. Hence you should not use JPEG if you
have to have identical output bits. However, on typical real-world
images, very good compression levels can be obtained with no visible
change, and amazingly high compression is possible if you can tolerate
a low-quality image. You can trade off image quality against file size
by adjusting the compressor's "quality" setting.

This reading and writing is based in part on the work of the
Independent JPEG Group

1.8 DataTypes Files

The datatypes.library provides transparent data handling abilities to
applications. If TIFFView finds an image it can't read it asks to
the datatypes.library to read the file. This enables TIFFView to
read a lot more image types.

This is available from WorkBench 3.0 and higher.

1.9   System Requirements

                        TIFFView should run on any Amiga system with at least 512K RAM ↩
                        and one
disk-drive. TIFFView requires KickStart v2.04 or higher to run.

   TIFFView also requires the ReqTools.library v38 or higher. ReqTools is
copyright 1993 by Nico François.

   Should you have any trouble running TIFFView on your machine, please

                write to me
                 with the full specifications of your machine, that is
KickStart version, model, expansion boards etc...

1.10   How to use TIFFView

   TIFFView can be started from the Shell or the Workbench.

   CLI Usage:

     TIFFView [filename(s)] [-r file]
       -r file : startup ARexx command (no parameters yet).

   WB Usage:

     Shift select files and double click TIFFView.

1.11   TIFFView Menu's

                File Menu

                Preference Menu

                Operations Menu

1.12   File Menu

Open...
  Calls File Requester to select an image to load.

Scan...
  Not available.

Image Info...
  Shows information about the currently active image.

```
Print
  Prints the currently active image.

Kill Memory Image
  Removes the memory image from the currently selected image.

Save
  Saves the file using the name and path that shows in the title bar.  Only
  enabled if something was changed to the Image and the full image is in
  memory.

Save As...
  Saves the file using an option requester and a File Requester to select
  options, name and path.

Close
  Closes the currently active window.
  Asks if changes have to be saved if needed.

Quit
  Closes all TIFFView windows and Quits.
```

1.13 Preference Menu

```
                First Image Only
  Used for multiple image
                TIFF
                 and
                GIF
                 Files.
  If you check this option the reading will be slightly faster but only the
  first image of multiple-image files will be shown and you are not warned of
  the presence of more images in the file.

Full File Names
  If this is checked then the window title bar will show complete file path.

Screen Mode...
  Shows a requester to define custom screen attributes.

Open Settings
  Keep Memory Image
  If checked and the original image has more colors like the screen image the
  complete full color image is kept in memory. This memory image is used for
  operations (Gamma) and for saving. This however can occupy a lot of memory.

  e.g.  A
                TIFF
                 24 bit image with the 'Keep Memory Image' option
     checked and a screen with an 8 bit representation requires 4 times the
     memory as without the memory image.

  note: A memory image can be removed later by selecting the Kill Memory
     Image menu option.
```

```
  All On Custom Screen
  If checked, all images (also 1 bit images) open on the custom screen,
  otherwise 1 bit images open on the workbench screen.

  Full Size
  Images always open starting in Top Left corner and the maximum window size is  ←
     used.

  Cascade
  Images are opened relative to previous opened window and shifted to
  left and bottom.

Buildin
  TIFF
  IFF
  GIF
  MacPaint
  JPEG{ui}
  Enables the buildin code to read this image types.  If you want to read
  an image with a datatype, switch off the menu item for that image type.

Printer Settings
  Half Size
  Normal Size
  Double Size
  Allows to set an enlargement factor for printing.

  Extra Info
  Allows enabling of printing some information about the picture.

  Center Horizontal
  Sets print position.

Save as Settings
  The Save as Settings are there to specify what kind of image has to be the
  default type for the Save As Options...  requester.

  The
                  TIFF
                   comp.  mode option is there to generate a more compatible
                  TIFF
                    file for transportation across computers & applications:
  - Some
                  TIFF
                   readers don't support 2 or 3 bit
                  TIFF
                   files.
    (so 2 and 3 bit
                  TIFF
                   files are converted to 4 bit
                  TIFF
                   files when saving).
  - 1-Bit
                  IFF
                   or
                  GIF
```

```
                      is saved as
                 TIFF
                  Line-Art (color information is removed)
    otherwise 1-Bit
                 IFF
                  and
                 GIF
                  is saved as a Palette
                 TIFF
                  of 1 Bit and the
    color information remains intact.

  Without
                 TIFF
                  comp. mode ON the generated
                 TIFF
                  files are also correct
  according to the
                 TIFF
                  6.0 standard but less common accepted by some other
  applications.

  Create Icons?
  Allows enabling of icon creation for saved files. TIFFView looks for ENV:Sys/ ←
     def_tiff, ENV:Sys/def_jpeg and ENV:Sys/def_ilbm
  for the creation of it's icon. If these are not found ENV:Sys/def_picture is  ←
     tried.

Dithering Settings
  No Dithering
  Dithering is disabled.
  Simple
  Just a simple and fast one dimensional dithering.
  Floyd & Steinberg
  Good and fast 2-dimensional dithering.
  Jarvis, Judice & Ninke
  Slow dithering over 3 lines.
  Stucki
  Slow dithering over 3 lines.
  Stevenson & Arce
  Slow dithering over 5 lines.

  Gray
                 TIFF
                  The dithering is for converting
                 TIFF
                  files to
  1, 2, 3, 4 or 6 bit Gray images.

  Color
                 TIFF
                   Color to Gray: Converts Color to Gray according to the Gray  ←
                       settings.
  Color to 3 Bit: 1 bit red, 1 bit green and 1 bit blue.
  Color to 5 Bit: 2 bit red, 2 bit green and 1 bit blue.
  Color to 6 Bit: 2 bit red, 2 bit green and 2 bit blue.
  Color to 8 Bit: 3 bit red, 3 bit green and 2 bit blue.
```

```
   Palette
                   TIFF
                     Remains untouched if the number of colors is less or equal to  ←
                        the value
   specified in the color to menu.
   Otherwise it is re-dithered to the value specified in the color to menu.
   See Color
                   TIFF
                   .

   Gray
                   GIF
                     The dithering is for converting
                   GIF
                    files to 1, 2, 3, 4 or 6 bit images.

   Color
                   GIF
                     Remains untouched if the number of colors is less or equal to  ←
                        the value
   specified in the color to dithering menu.
   Otherwise it is re-dithered to the value specified in the color to menu.
   See Color
                   TIFF
                   .

                   IFF
                     Remains untouched if the number of colors is less or equal to  ←
                        the value
   specified in the color to dithering menu.
   Otherwise it is re-dithered to the value specified in the color to menu.
   HAM & EHB
                   IFF
                    files are not supported.

Scroll Settings
   Sets scroll speed when clicking arrows from scroll bars.

Unit Settings
   Used by printing for extra print information.
   Used in Image Info Window to show image size.

Load Settings@.{ub}
   Use these menu items to load a settings file.

Save Settings
   Use these menu items to save the current settings to the tiffview.prefs file.

Save Settings As...
   Use these menu items to save the current settings as a preset.
```

1.14   Operations Menu

```
Gamma mapping...
  Allows definition of gamma curve to re-map the image.

  Higher Gamma values give more detail in Dark Image parts (brighter Images).
  Lower Gamma values give less detail in Dark Image parts (Darker Images).

  No gamma is 1.0.

  A Good value for dark images should be 1.5.
```

1.15   ARexx Port

```
   TIFFView is equipped with an ARexx Port. The name for the ARexx Port is
'tiffview'.  So if you want to send commands to that port you would have
to issue

              ADDRESS 'tiffview'

If you have more TIFFView's running '-number' is appended to the port name.

  DoMenuItem Menu Item [Sub [val]] executes a menu item like if it was selected.
  Ex: domenuitem 1 6 1 ON selects scrolling speed normal

```

1.16   Known Problems

                   If an image is dithered to more colors then the available colors ←
                     of the screen, the
image will look bad, but it is correctly in memory so saving the image will
work correct.

e.g. Opening an
                   IFF
                    5 bit image (32 colors) with dithering color to 5 bit
   on an interlaced 4 bits (16 colors) screen gives a bad image on that screen.

1.17   Tips

On a system with not much memory or if you only use TIFFView for viewing
leave the 'Keep Memory Image' in the 'Open Settings' sub menu off.
This saves a lot of memory if you open 24 bit images, but does not allow
you to use the Save menu item (Save As works!!) if the image has changed.

1.18   ToDo

                     24 bit
                 IFF
                    reading & saving (request by Jean-Pierre LeBel)
   Image cropping tool (request by Jean-Pierre LeBel)
   Implement Scanning with AGFA scanners (request by Jochen Brusseler)

1.19   About the program

                   Current version 1.16

   This program is freeware, this means that you can copy it freely as
long as you don't ask any more money for it than a nominal fee for copying.
If you want to distribute this program you should keep this document with
it. This program cannot be used for commercial purposes without written
permission from the
                   author
                     .

   TIFFView has proven to be stable in everyday use. The author is not

responsible for any loss of data, damages to software or hardware that may
result directly or indirectly from the use of this program. The author
reserves the right to make changes to the software or documentation without
notice.

   TIFFView was written in C and compiled using SAS/C 6.55.

None of the files of the TIFFView package may be modified. Crunching or
achieving is allowed only if none of the TIFFView files get modified by it.

1.20   About the Author

   If you have suggestions or remarks about this program, or if you
   find any bugs, please let me know.

   When sending in bug reports, please state exactly under what
   circumstances the bug occurred, what equipment was used and what
   happened. If possible also try to give me enough information to
   reproduce the bug. It is very difficult to find bugs when you
   don't know exactly what happened.

   Write to the following address:

       email   : bert.wynants@innet.be

       Fido   : 2:292/603.76 (Bert Wynants)

1.21   Program History

                 Changes & Fixes:

   1.16
     Fixed guru on 68000 machines, 1.15 would only work correctly on
        a 68030+ (Thanks to Bill Bennett and others for reporting)
     Fixed bad icon in 1.15 archive (Thanks to Rudy Kohut for reporting)
        Sorry, it's back the old icon, nothing fancy :-)
     Fixed broken IFF reading
     Changed email adress

   1.15
     added TIFF.Datatype to archive
     several small fixes
     recompiled with SAS/C 6.55
     used JPEG Code 5b

   1.14

```
    ENV:Sys/def_picture added for icon creation
    JPEG reading and writing added
    File Saving choice for memory/screen image fixed
    Fixed update problem with very small images
```

  1.13
```
    Width and Height update on the fly if the resolution changes in info window.
    Busy requester has a progress bar now.
    All requesters have the ReqTools backfill look now.
    Using GetDiskObjectNew for WB startup now.
    Aborting Creating Screen Image no longer gives a Memory Error.
    Scroll bars have newlook and are one linked boopsi gadget.
    Setting Scroll Speed for arrows works better.
    Buildin sub menu added to override buildin reading by datatype reading.
    Added support for datatypes for unknown image types.
    Added icon creation for saved files.
    Settings Load/Save added.
    Task and port names for multiple instances of TIFFView improved and corrected.
    Workbench color changing fixed. (Thanks to Peter Stuer for reporting)
    Public screen handling fixed and improved.
```

  1.12
```
    Handling more multiple image TIFF files correctly now...
    Gamma mapping on a CMYK image worked inverse.
    Multiple Image GIF files are now also supported.
    Complete revision of GIF reading, now I think it even works :-)
      thanks to all those who reported GIF reading bugs (Bart, Peter, Tom...).
```

  1.11
```
    Save/Discard/Cancel Dialog added

            IFF
             dithering added
    Search scanner option removed
    Gamma handling moved to image windows menu's

            MacPaint
             reading added
    Screen closing fixed for visitor window (e.g. Scale by Erik Wistrand)
    interleaved screen and bitmaps added
    bugfix for
            IFF
             & interleaved screen
    3.0 NewLook Menu's added
    color to gray conversion uses luminance calculation now
    CMYK image conversion corrected
    removed 1.3 compatibility
    printing can be aborted now
    now the custom screen uses the user font also
    all requesters font sensitive
    requester added for saving options
    localized under OS2.1 and higher
    rewrite of internal ARexx handling
```

  1.10
```
    Save as gives warning if destination file already exists.
    some bugfixes in ARexx part.
```

```
1.09
  Abort added for opening and saving images.
  CMYK image conversion added (
              TIFF
               only).
  Multiple file selection in file requester.
  Choosing between images in case of some mullet image
              TIFF
               files.
    (requested by Peter Stuer, not all multiple image files are yet supported)
  Window tiling added for opening images. (Suggested by Peter Stuer)
  Preferences moved to ENVARC: on a 2.0 or 3.0 system.
    (Suggested by Peter Stuer)
  Corrected Default prefs for 3.0.
