Octave Quick Reference Octave Version 1.0

Starting Octave

octave start interactive Octave session octave file run Octave on commands in file octave --help describe command line options

Stopping Octave

quit or exit exit Octave

INTERRUPT (e.q. C-c) terminate current command and

return to top-level prompt

Getting Help

help list all commands and built-in variables

help command briefly describe command

help -i use Info to browse Octave manual

help -i command search for command in Octave manual

Motion in Info

SPC or C-v scroll forward one screenful DEL or M-v scroll backward one screenful

C-1 redraw the display

Node Selection in Info

select the next node select the previous node select the 'up' node select the 'top' node select the directory node

select the first node in the current file select the last node in the current file reads the name of a node and selects it

kills the current node

Searching in Info

search for a string

C-s search forward incrementally C-rsearch backward incrementally

search index & go to corresponding node go to next match from last 'i' command

Command-Line Cursor Motion

C-b move back one character C-f move forward one character move the the start of the line C-a С-е move to the end of the line M-f move forward a word M-b move backward a word

C-1 clear screen, reprinting current line at top

Inserting or Changing Text

M-TAB insert a tab character DEL delete character to the left of the cursor

C-ddelete character under the cursor add the next character verbatim C-v C-t transpose characters at the point transpose words at the point

surround optional arguments ... show one or more arguments

Copyright 1994, John W. Eaton Permissions on back

Killing and Yanking

C-k kill to the end of the line C-y yank the most recently killed text M-dkill to the end of the current word M-DEL kill the word behind the cursor M−v rotate the kill ring and vank the new top

Command Completion and History

complete a command or variable name TAB M-? list possible completions RET enter the current line С-р move 'up' through the history list C-n move 'down' through the history list M-< move to the first line in the history M-> move to the last line in the history C-r search backward in the history list C-s search forward in the history list history [-q] [N] list N previous history lines, omitting history numbers if -q history -w [file] write history to file ("/.octave_hist if no file argument) history -r [file] read history from file ("/.octave_hist if no file argument) edit_history lines edit and then run previous commands from the history list

 $\begin{bmatrix} beq \end{bmatrix} \begin{bmatrix} end \end{bmatrix}$ Specify the first and last history commands to edit or run.

If beg is greater than end, reverse the list of commands before editing. If end is omitted, select commands from beg to the end of the history list. If both arguments are omitted, edit the previous item in the history list

run previous commands from the history

Shell Commands

run_history lines

cd dir change working directory to dir рwd print working directory 1s options print directory listing getenv (string) return value of named environment variable shell_cmd (cmd) execute arbitrary shell command string

Matrices

Square brackets delimit literal matrices. Commas separate elements on the same row. Semicolons separate rows. Commas may be replaced by spaces, and semicolons may be replaced by one or more newlines. Elements of a matrix may be arbitrary expressions, provided that all the dimensions agree.

 $[x, y, \dots]$ enter a row vector $[x;y;\dots]$ enter a column vector [w, x; y, z]enter a 2×2 matrix

Ranges

base: limit base:incr:limit

Specify a range of values beginning with base with no elements greater than limit. If it is omitted, the default value of incr is 1. Negative increments are permitted.

Strings and Common Escape Sequences

A string constant consists of a sequence of characters enclosed in either double-quote or single-quote marks.

11 a literal backslash \ '' a literal double-quote character ν, a literal single-quote character newline. ASCII code 10 \n horizontal tab, ASCII code 9 \t

Index Expressions

var(idx)select elements of a vector var(idx1, idx2)select elements of a matrix scalarselect row (column) corresponding to scalar select rows (columns) corresponding to the vectorelements of vector select rows (columns) corresponding to the rangeelements of range

Global Variables

global var1 ... Declare variables global. Global variables may be accessed inside the body of a function without having to be passed in the function parameter list provided they are also declared global within the function.

editor to use with edit_history

select all rows (columns)

Selected Built-in Variables

Inf, NaN IEEE infinity, NaN LOADPATH path to search for function files PAGER program to use to paginate output last result not explicitly assigned ans machine precision

eps

рi

EDITOR

realmax maximum representable value minimum representable value realmin

automatic_replot do_fortran_indexing implicit_str_to_num_ok output_max_field_width output_precision page_screen_output prefer_column_vectors resize_on_range_error save_precision silent_functions warn_divide_by_zero

automatically redraw plots Fortran-style indexing of matrices allow strings to become numbers maximum numeric field width min significant figures displayed control whether output is paged create column vectors by default automatic resizing of matrices digits stored by save command suppress output from functions suppress divide by zero errors

commas_in_literal_matrix

control handling of spaces in matrices

ignore_function_time_stamp

ignore changes in function files during session

ok_to_lose_imaginary_part

allow complex to real conversion

prefer_zero_one_indexing

if ambiguous, prefer 0-1 style indexing

Arithmetic and Increment Operators

	• • • • • • • • • • • • • • • • • • •
x + y	addition
x - y	subtraction
x * y	matrix multiplication
x .* y	element by element multiplication
x / y	right division, conceptually equivalent to
	(inverse (y') * x')'
x ./ y	element by element right division
$x \setminus y$	left division, conceptually equivalent to
	inverse (x) * y
$x \cdot y$	element by element left division
x ~ y	power operator
x . ~ y	element by element power operator
- x	negation
+ x	unary plus (a no-op)
x,	complex conjugate transpose
x .,	transpose
++ x (x)	increment (decrement) x, return new value
x ++ (x)	increment (decrement) x_1 return old value

Assignment Expressions

var = expr	assign	expression	to	variable	
var (idx) = expr	assign	expression	to	indexed	variable

Comparison and Boolean Operators

These operators work on an element-by-element basis. Both arguments are always evaluated.

x < y	true if x is less than y
$x \le y$	true if x is less than or equal to y
x == y	true if x is greater than y
$x \ge y$	true if x is greater than or equal to y
x > y	true if x is equal to y
x != y	true if x is not equal to y
x & y	true if both x and y are true
$x \mid y$	true if at least one of x or y is true
! bool	true bool is false

Short-circuit Boolean Operators

Operators evaluate left-to-right, expecting scalar operands. Operands are only evaluated if necessary, stopping once overall truth value can be determined. Operands are converted to scalars by applying the all function.

x && y	true if both x and y are true
$x \mid \mid y$	true if at least one of x or y is true

Operator Precedence

Here is a table of the operators in $Octave_1$ in order of increasing precedence.

; ,	statement separators
=	assignment, groups left to right
&&	logical "or" and "and"
&	element-wise "or" and "and"
< <= == >= > !=	relational operators
:	colon
+ -	addition and subtraction
* / \ .* ./ .\	multiplication and division
, , ,	transpose
+ - ++ !	unary minus, increment, logical "not"
· . ·	exponentiation

Statements

for $identifier = expr\ stmt-list\ endfor$

Execute *stmt-list* once for each column of *expr*. The variable *identifier* is set to the value of the current column during each iteration.

while (condition) stmt-list endwhile

Execute stmt-list while condition is true.

break	exit innermost loop

continue go to beginning of innermost loop
return return to calling function

if (condition) if-body [else else-body] endif

Execute if-body if condition is true, otherwise execute elsebody.

if (condition) if-body [elseif (condition) elseif-body] endif

Execute if-body if condition is true, otherwise execute the elseif-body corresponding to the first elseif condition that is true, otherwise execute else-body.

Any number of ${\tt elseif}$ clauses may appear in an ${\tt if}$ statement.

unwind_protect body unwind_protect_cleanup cleanup end

Execute body. Execute cleanup no matter how control exits body.

Defining Functions

```
function [ret-list] function-name [(arg-list)]
function-body
endfunction
```

ret-list may be a single identifier or a comma-separated list of identifiers delimited by square-brackets.

arg-list is a comma-separated list of identifiers and may be empty.

Basic Matrix Manipulations

rows (a)	return number of rows of a
columns (a)	return number of columns of a
all (a)	check if all elements of a nonzero
any (a)	check if any elements of a nonzero
find (a)	return indices of nonzero elements
sort (a)	order elements in each column of a
sum(a)	sum elements in columns of a
prod (a)	product of elements in columns of a
min (args)	find minimum values
$\max (args)$	find maximum values
rem(x, y)	find remainder of x/y
reshape (a, m, n)	reformat a to be m by n

diag(v, k)	create diagonal matrices
linspace (b, l, n)	create vector of linearly-spaced elements
logspace (b, l, n)	create vector of log-spaced elements
eye (n, m)	create n by m identity matrix
ones (n, m)	create n by m matrix of ones
zeros(n, m)	create n by m matrix of zeros
rand (n, m)	create n by m matrix of random values

Linear Algebra

chol (a)	Cholesky factorization
\det (a)	compute the determinant of a matrix
eig (a)	eigenvalues and eigenvectors
expm(a)	compute the exponential of a matrix
\mathtt{hess} (a)	compute Hessenberg decomposition
inverse (a)	invert a square matrix
norm (a, p)	compute the p-norm of a matrix
pinv (a)	compute pseudoinverse of a
qr(a)	compute the QR factorization of a matrix
rank(a)	matrix rank
schur (a)	Schur decomposition of a matrix
svd (a)	singular value decomposition
$ extsf{syl}$ (a , b , c)	solve the Sylvester equation

Equations, ODEs, DAEs, Quadrature

*ISOIVe	soive nonlinear algebraic equations
*lsode	integrate nonlinear ODEs
*dassl	integrate nonlinear DAEs
*quad	integrate nonlinear functions

perror (nm, code) for functions that return numeric codes,
print error message for named function
and given error code

* See the on-line or printed manual for the complete list of arguments for these functions.

Signal Processing

fft (a)	Fast Fourier Transform using FFTPACK
ifft (a)	inverse FFT using FFTPACK
freqz (args)	FIR filter frequency response
sinc(x)	returns sin $(\pi x)/(\pi x)$

Image Processing

colormap (map)	set the current colormap
gray2ind(i, n)	convert gray scale to Octave image
image (img, zoom)	display an Octave image matrix
imagesc (img, zoom)	display scaled matrix as image
imshow (img , map)	display Octave image
imshow(i, n)	display gray scale image
imshow (r, g, b)	display RGB image
${ t ind2gray}$ (img, map)	convert Octave image to gray scale
ind2rgb (img, map)	convert indexed image to RGB
loadimage (file)	load an image file
rgb2ind(r, g, b)	convert RGB to Octave image
saveimage (file, imq, fm	t, map) save a matrix to file

Sets

$create_set(a, b)$	create row vector of unique values
complement(a, b)	elements of b not in a
intersection ($a,\ b$)	intersection of sets a and b
union (a, b)	union of sets a and b

Strings

strcmp(s,	t)	compare strings
strcat (s,	t, \ldots	concatenate strings

C-style Input and Output

fopen (name, mode) open file name fclose (file) close file printf (fmt, ...) formatted output to stdout fprintf (file, fmt, ...) formatted output to file sprintf(fmt, ...)formatted output to string scanf(fmt)formatted input from stdin fscanf (file, fmt) formatted input from file sscanf(str, fmt)formatted input from string fgets (file, len) read len characters from file fflush (file) flush pending output to file ftell (file) return file pointer position frewind (file) move file pointer to beginning freport print a info for open files fread (file, size, prec) read binary data files fwrite (file, size, prec) write binary data files feof (file) determine if pointer is at EOF

A file may be referenced either by name or by the number returned from fopen. Three files are preconnected when Octave starts: stdin, stdout, and stderr.

Other Input and Output functions

save file var ... save variables in file load file load variables from file disp (var) display value of var to screen

Miscellaneous Functions

eval(str)evaluate str as a command feval (str, ...) evaluate function named by str. passing remaining args to called function error (message) print message and return to top level

clear pattern clear variables matching pattern exist (str) check existence of variable or function who

list current variables

Polynomials

compan(p)companion matrix conv(a, b)convolution deconv(a, b)deconvolve two vectors poly (a) create polynomial from a matrix polyderiv (p) derivative of polynomial polyreduce (p) integral of polynomial polyval (p, x)value of polynomial at xpolyvalm (p, x)value of polynomial at xroots (n) polynomial roots residue (a, b) partial fraction expansion of ratio a/b

Statistics

corrcoef(x, y)correlation coefficient cov(x, y)covariance mean (a) mean value median (a) median value std (a) standard deviation **var** (a) variance

Basic Plotting

gplot [ranges] expr [using] [title] [style] 2D plotting gsplot [ranges] expr [using] [title] [style] 3D plotting specify data ranges ranges

exprexpression to plot specify columns to plot usingtitlespecify line title for legend specify line style style

If ranges are supplied, they must come before the expression to plot. The using, title, and style options may appear in any order after expr. Multiple expressions may be plotted with a single command by separating them with commas.

set options set plotting options show options show plotting options replot redisplay current plot

closeplot close stream to gnuplot process purge_tmp_files clean up temporary plotting files

automatic_replot built-in variable

Other Plotting Functions

plot (aras) 2D plot with linear axes semilogx (args) 2D plot with logarithmic x-axis semilogy (args) 2D plot with logarithmic y-axis loglog (args) 2D plot with logarithmic axes bar (args) plot bar charts stairs (x, y)plot stairsteps hist(y, x)plot histograms title (string) set plot title axis (limits) set axis ranges xlabel (string) set x-axis label ylabel (string) set y-axis label grid on off set grid state hold on off set hold state ishold return 1 if hold is on, 0 otherwise mesh(x, y, z)plot 3D surface meshdom(x, y)create mesh coordinate matrices
