Print2Pict is a printer driver that creates PICT files of the printed pages. One file per page is written to the default disk.

The PICT files are named "Appli•Doc•Page" where Appli   is the application name, Doc   the document name and Page   the page number.

This file can then been read by any software reading PICT format.

Note :
If you print with the 50% reduction, picture will by defined in a rectangle 200% bigger. You can then include it in a document and reduce it to its half.

Bugs : - The documents' name are not always right.

If you like this software, please send $10 to:
