

Fontsie 3.0

Preliminary Documentation

Fontsie 3.0 is an INIT resource with a single purpose: to allow you to have access to fonts stored not in the System file, but in font files on disk. It is similar to version 2.0, with two major differences. First, it is an INIT resource that you install by dragging into the Sytem folder of any boot disk with System 3.1 or later. Second, instead of presenting you with a list of files and asking you to choose, it automatically looks in the System Folder (under HFS - the folder containing System and Finder) for a folder named "Fonts," and installs the fonts in any Font/DA mover files in that folder (unless the file name begins with a period).

A Macintosh with 512K of memory (or more) and HFS are strongly recommended to use this version of **Fontsie**. You **must** have HFS in order to run the configuration program.

Installing Fontsie

Fontsie 3.0 is distributed as an INIT resource. Before you use it, you should configure it with the Configuration program provided. After you have done that, just drag it into the System folder of the disk you use to boot your Macintosh and reboot. **Fontsie** will be automatically installed. If you don't want to install it at boot time, you can either remove it from the System folder or hold down the Caps Lock key while booting. As you boot, it will display a message to show that it is active. If you boot from one disk and run from others, **Fontsie** should be in the System file of the disk you boot from. It need not be on the other disk(s).

You can invoke **Fontsie 3.0** by holding down the Caps Lock key when you start up an application. If you don't hold this key down, **Fontsie** will not install any fonts. If you want your extra fonts available when you are in the Finder, hold down the Caps Lock key when you Quit an application.

Configuring Fontsie

Fontsie should have come to you with a configuration program. You should use that program to do two things:

First, you must tell **Fontsie** what folder your font files will be in. The file should already be in existence when you run the configuration program, and it should have at least one Font file in it at that time.

Second, you may or may not want to have **Fontsie** ever operate when you Quit an application and return to the Finder. The configuration program lets you set this.

A later version of **Fontsie** and the configuration program will let you choose whether the fonts will always be installed **unless** the Caps Lock key is down, or whether they will

be installed **only if** the Caps Lock key is down.

If you got a copie of **Fontsie** without the configuration program, you can set the folder with ResEdit by modifying the STR resource in **Fontsie's** file. Don't include the final colon: in other words, if you want to run them from a folder named "My Fonts" on a disk named "MyDisk", the string should read "MyDisk:MyFonts".

Using Fontsie

Put the file(s) containing the font(s) you want to use in the folder you have chosen. The fonts should be in standard Font/DA Mover files. You may have more than one font in each file, and you may use more than one file. Be warned, however, that if you have a very large number of font files in your fonts folder, some applications may have trouble opening all the files they need. If there are several fonts that you use at the same time, it's better to put them all in a single Font/DA Mover file.

If you want to use additional sizes of a font some sizes of which are already installed in the System file, it is best to put all the sizes -- even those that are already in the System -- in the Font/DA Mover file.

The files can have any name that doesn't begin with a period ("."). If the file name begins with a period, **Fontsie** won't open it. This is so you can easily keep some fonts from being installed without having to move the files around into different folders. Just rename the file so that it starts with a period (e.g., ".Athens"). If you want to use it later, just remove the period.

When you launch an application in which you want to use the additional fonts, just press the Caps Lock key before the application is launched and make sure it stays down until the application opens. You should find all of the additional fonts ready and available for your use. They will remain available until you Quit the application. If you want to have them available in the Finder (for instance, to use with desk accessories), just press the Caps Lock key when you quit the application, and be sure it stays down until the Finder is active.

Known Limitations. **Fontsie** does no checking to see if there is a duplicate font number or a duplicate font name. In addition, some older fonts may behave oddly if they were put in the suitcase file with a version of Font/DA Mover earlier than 3.2 (and thus lack a "FOND" resource). When in doubt or difficulty, use Font/DA Mover to reinstall the font in the file you want to use.

If you save a document, the font information will be saved with it, but the font will not be automatically loaded when you run the program again after quitting -- unless, of course, the font file is still in the "Fonts" folder in the System folder, and you invoked **Fontsie** by holding the Caps Lock key down when the application ran.

Revision History and Planned Enhancements

Version 3.02 (April 16, 1987) is the first release of this version. It is a free upgrade to

all people who registered previous versions of **Fontsie**.

Version 3.02 rereleased April 18, 1987, with version 1.0 of the configuration program.

Shareware Registration; Disclaimer of Warranty

Fontsie 3.0 isn't public domain software: it's shareware, and it's copyrighted. If you obtained a copy with this documentation, I encourage you to try it out for up to a month; but if you continue to use it after that time, you must send me \$5.00 for registration. (\$10 if you want a copy of the latest version -- and a variety of other goodies, some of which are free and some of which are additional shareware -- on disk.) If you use it, please register: you can easily spend more than the \$5 registration fee on a big lunch at MacDonalds, and it has cost me considerable time and effort to develop the program.

Multiple Users, Multiple Computers. Registering **Fontsie** entitles one person to use it on as many computers as you like, **OR** allows many people to use it on one computer. **If you intend that more than one person will use it on more than one computer** (for example, if several people in one office are using it on several different computers), you should send me one registration fee for each person who will be using the program, or for each computer on which it will be used, whichever is less. If you are interested in obtaining a site license for unlimited users and computers at one location, please contact me; I'd be happy to negotiate equitable terms.

If you registered **any** previous version of **Fontsie**, you should consider version 3.0 a free upgrade.

It will help me in knowing where to post upgrades if, when you register, you tell me what version you have and where you got it.

Users' groups may freely distribute **Fontsie 3.0** under three conditions: (1) you distribute this documentation file and the configuration program along with **Fontsie**; (2) you aren't charging users significantly more than your costs of duplication and distribution for the disks you distribute; and (3) if you charge anything for the disks, you let me know (by postcard, electronic mail, or otherwise) that you are distributing **Fontsie**, and which version you are distributing.

Fontsie may be posted on any **bulletin board** without my prior permission so long as this documentation file and the configuration program is posted along with it. I'd appreciate knowing where you post it, but that's a wish, not a requirement.

Individuals may make as many copies of registered versions of **Fontsie** as they want for their own use, and as many copies as they want for other people as long as the documentation file and the configuration program is always included with it on copies they make for others.

Any other redistribution of **Fontsie** without my express written permission is forbidden.

I have written **Fontsie** with care and tried to test it well. However, I can't test it in all circumstances and with all possible hardware and software configurations. Accordingly, **I can assume no responsibility for errors made, or damage caused, by its use. It comes with no warranty, express or implied.** (If you find this frightening, I can also say that I use it on my own Macs regularly.) However, your state law may give you additional warranty rights.
