New versions can be obtained from Aminet or directly from the author.

1.2 important

              If you are using this program on a read only file system or if you ←
                 don't want
that your file comment will be overwritten, you must disable the the

              write Comment
              function.

For read only file systems you should also disable the orther three functions:

              replace

              auto replace

              complete

1.3 History

              1.x   ~ a year ago   History stripped

2.0   (10.02.1997) · Complete rewrite
2.1   (14.02.1997) · various bugfixes
2.2   (17.02.1997) · "Preferences Editor" implemented as DOpus toolbar :-)
                     · The month in the version string was always one month
                       too high
2.3   (25.02.1997) · If REPLACES and REPLACED were disabled, the abort ←
   requester
                       'You must set more compare criteriums' appeared
       (26.02.1997) · Ports are closed with FORBID/PERMIT
                     · File variables are dropped/freed
2.4   (04.03.1997) · Wrote this guide
2.5   (16.03.1997) · As variables were dropped to early sometimes, I disabled
                       this function until I can fix it
                     · Output of the Install_Preferences.dopus5 ('show Settings'
                       button) improved
                     · Fixed three links in this guide
                     · Added new sections and links to the guide
                     · The program is fully localized now
2.6   (17.03.1997) · As I'm waiting now for the subtasks, there should be no
                       more endless loops because of lost packets
                     · c:Version and c:Delete were added even if they were

```
                           already present
                         · CleanUP code wasn't executed as it should
                         · Forgot to translate two strings in Install_Request
                         · Dropping of variables works now
   2.7    (18.03.1997)   · Bug in a requester removed
                         · Wrote german documentation
                         · Improved the documentation
   2.8    (19.03.1997)   · Fixed some wrong links in the german guide
                         · Exchanged buttons in the german button bar moved
                           back
   3.0    (01.04.1997)   · A patch to fix this ugly endless loop / crash in
                           c:version included (from Urs Eprecht). It occured
                           if there was a $ sign in the last four bytes of a
                           file.
                         · A minor change in the german catalog
                         · Updated installer scripts and guides
   3.1    (09.05.1997)   · Fixed problems with spaces in the path
                         · Added some 'Call's to avoid result values being
                           executed as rexx commands
                         · Cosmetic bugfixes in the error requesters
                         · Due to a bug in ARexx, some error requester
                           always showed 'invalid message packet'
                         · The hidden listers are closed after all PORTS
                           had been closed to avoid an 'arithmetic conversion
                           error' (only occured if you pressed ctrl-c in
                           the ouptut window)
                         · Delete protected files are automatically deprotected
                           if necessary
                         · Better checking and warning for delete protected
                           files
                         · Changes in the installer script, the guide and
                           the locale files
   3.2    (01.06.1997)   · Fixed a never considered case: After having copied
                           a file, it's variables were dropped. If the destination
                           files scanner hadn't scanned this directory yet, it
                           would have found this file after the variables were
                           dropped. The program tried to compare these files and
                           as variables were missing, an 'arithmetic conversion
                           error' occured
   3.3    (05.06.1997)   · The catalog is again copied to 'LOCALE:' instead of
                           'DOpus5:Locale' because without an additional
                           'assign LOCALE: DOpus5:Locale ADD', rexx couldn't find
                           the catalog. Unfortunately there is no possibility
                           to open a catalog in a certain directory (in rexx)
                           as far as I know
                         · Additions to the guide
                         · Please read the
                 known bugs
                 section!
```

1.4 future

```
        Listed in decreasing priority:
```

- Option for a requester if a file only exists in either source or destination
  (Choices: Complete, Delete, Skip)
- Progress bar including abort button
-

                  icon compare
                  routine

- only search version if both files exist and both have a different
                  crc
                - compiled version if possible
  (I compiled it with rexxplus:
   - The size of every file became about 10 times greater.
   - I haven't been able to gain a single second
   I think we can forget a compiled version
   Optimizing with RexxOpt made the program unusable and even slower)
- write
                  crc
                  /Hex Date/Version to file instead of comment

Send me your requests!

1.5 Known bugs

- Doesn't support the special character translation FFS Internationl supports.
  Eg. çatefaitplaisirjon is not equal to Çatefaisplaisirjon.
- Unfortunately, it's slow, even on a 060. The concept is too good for the
  overhead of ARexx.
- Due to a bug in DirectoryOpus, you can get two source lister what is
  illegal. DOpus seems to be a bit confused then about the state of this
  lister. It will always be source or off, but never destination. You
  have to leave the directory (parent) and then reenter it to restore normal
  behaviour.

Send me your bug reports!

1.7 Introduction to Install.dopus5

                    Is it useful for me?

Do you have more than one amiga? Do you have to update other amigas with the
latest libraries/tools etc?

If yes, this program is very useful for you!

As far as I know, there is by for no other program available with the same
functionality.

What does it?

It installs complete directory trees from one harddrive/path/
                source
                to another
harddrive/path/
                destination
                , if you want, even in both directions.

It is smart: It scans the
                 size
                ,
                 creation date
                ,
                 version base name
                ,
                 version
                ,

                 revision
                 and
                 version date
                 of each file. If all of these points (or at least
all of those you've enabled in the
```

```
                    preferences editor
                 ) declare a file to be
newer, the older one will
                 automatically be replaced
                 by the newer. If it's not
clear which file is newer, a
                 requester
                 will ask you which file you want to
replace.

If you want, it
                 completes directories
                 , from
                 source
                 to
                 destination
                 ,
                 destination
                 to
                 source
                 or in both directions.
```

```

1.9 Installing Install.dopus5

```
If you don't like my installer script, you can do it manually:

Quelle                                 Ziel

Needed:

ARexx/Install_Execute.dopus5           DOpus5:ARexx/Install_Execute.dopus5
ARexx/Install_GetID.dopus5~            DOpus5:ARexx/Install_GetID.dopus5
ARexx/Install_Main.dopus5              DOpus5:ARexx/Install_Main.dopus5
ARexx/Install_Preferences.dopus5       DOpus5:ARexx/Install_Preferences.dopus5
ARexx/Install_Request.dopus5           DOpus5:ARexx/Install_Request.dopus5
```

```
ARexx/Install_Scan.dopus5               DOpus5:ARexx/Install_Scan.dopus5
ARexx/Install_Startup.dopus5            DOpus5:ARexx/Install_Startup.dopus5

Libs/rexxdossupport.library             Libs:rexxdossupport.library
Libs/rexxtricks.library                 Libs:rexxtricks.library

System/Install_Locale.prefs             DOpus5:System/Install_Locale.prefs
System/Install_Main.prefs               DOpus5:System/Install_Main.prefs

If you prefer german:

Install.dopus5_ger.guide                DOpus5:Help/Install.dopus5_ger.guide
Buttons/Install_Preferences_deutsch     DOpus5:Buttons/Install_Preferences
Catalogs/deutsch/Install.dopus5.catalog LOCALE:Catalogs/deutsch/Install.dopus5. ←
    catalog

If you prefer english:

Install.dopus5_eng.guide                DOpus5:Help/Install.dopus5_eng.guide
Buttons/Install_Preferences_english     DOpus5:Buttons/Install_Preferences

If you'd like to write your own translation:
Catalogs/deutsch/Install.dopus5.cd
Catalogs/deutsch/Install.dopus5.ct
(I'd like to includem them in the Archive)
```

1.10   What you need to use Install.dopus5

```
              Screen size

If you have a small screen, the  replace requesters  could be to big. DOpus
automatically cancels/skips such
              requesters
            . ARexx can't remark this.
But you: If in the output window appears the text '[ASK  ] bla' and no

              requester
            appears asking you what to do with the file bla, you should
make a virtual screen that is big enough and try again.

OS

You need at least Kickstart/Workbench 2.1, but I've only tested it with 3.1.
Rexxmast must be running of course, the needed libraries must be available.

DirectoryOpus

You need at least Directory Opus Magellan.
5.5 won't work as the command 'dopus send' is missing.
```

Other files

```
rexxdossupport.library
Copyright (C) 1994-1997 by Hartmut Goebel, <hartmut@oberon.nbg.sub.org>

rexxtricks.library
Copyright (C) 1994,95 by Jürgen Kohrmeyer, <J_Kohrmeyer@wilam.north.de>

version.pch (strongly suggested)
Copyright (C) 1997 by Urs Eprecht
```

All these files are included in this archive.

```
The directory DOpus5:System/
Locale settings file ENV:Sys/Locale.prefs
And of course a correct installation of almost all other files delivered in this  ←
    archive.
```

1.11 Features/Preferences/Buttons

```
                    This is the default button bank named 'DOpus5:Buttons/ ←
                        Install_Preferences'
if you haven't changed the path.
```

With it, you can control all features. Of course you are free to modify it.

Keep in mind: Some buttons are only for information. You can't click on them!

These are the buttons you can't press as they are only for information:

```
 show Settings
                Source

                Destination

                compare Icons
                  yes

                write Comment
                  yes        yes            !! Install !!            reset to  ←
                      Defaults

                replace
                  yes        yes
                auto replace if...
                  same BaseName

                auto replace
                  yes        yes        Version higher        VersionDate  ←
                      higher

                complete
                  yes        yes        Size greater        FileDate higher
```

You can press the following buttons if you use your left Mouse button:

                    show Settings
                      Source   Destination   compare Icons
                    yes
                    write Comment
                    yes

                    yes

                    !! Install !!

                    reset do defaults
                    replace
                    yes

                    yes
                      auto replace if...
                    same BaseName
                    auto replace
                    yes

                    yes

                    Version higher

                    VersionDate higher
                    complete
                    yes

                    yes

                    Size greater

                    FileDate higher
                   You can press the following buttons if you use your right Mouse ↩
                      button:

                    show Guide
                      Source   Destination   compare Icons
                    no
                    write Comment
                    no

                    no

                    !! Install >libs: !!
                      reset to defaults
 replace
                    no

                    no
                      auto replace if...
                    ignore BaseName
                    auto replace

```
                    no

                    no

                    ignore Version

                    ignore VersionDate
                    complete
                    no

                    no

                    ignore Size

                    ignore FileDate
```

1.12 show Settings

```
                First it opens a window with the activated
                 functions
                and then one with
the activated
                 criteriums
                 to
                 replace automatically
                 .
```

1.13 show Guide

```
Opens this AmigaGuide/Help/Documentation.
```

1.14 write Comment Source/Destination

```
                Unfortunately, scanning a file for the
                 crc
                and version, takes
some time. To make it faster for the second time, the
                 crc
                and the version
string will be written into the files comment field. This can be
enabled (left mouse button) or disabled (right mouse button) for the
                 source
                and for the
                 destination
                . Don't forget to do this on read only file
systems!

Default: On for
                 source
                and
```

                              destination
                              .

1.15   replace Source/Destination

                  If you want that under no circumstances a file gets written to ←
                     either
the
                   source
                   or the
                   destination
                   , you can force this with this option.
Use it if you have a read only file system!

Default: On for
                   source
                   and
                   destination
                   .

1.16   auto replace Source/Destination

                  If a file passes all tests enabled in the 'auto replace if...' ←
                     section,
eg. a file is definately newer than the other, the older one will

                   automatically be replaced
                   by the newer.
If you disable this feature, you will always be asked before something gets
replaced. If you have disabled the
                   replace
                   option for
−
                   source
                    The
                   requester
                   hides the
                   repl. Source
                   button
−
                   destination
                    The
                   requester
                   hides the
                   repl. Dest
                   button
−
                   source
                   and
                   destination
                    The
                   requester

```
                      won't be opened and the files are simply
                      skipped
                      .

Default: On for
                      destination
                      , off for
                      source
                      .
```

1.17 Replace Requester

```
                  The requester looks like that:
 _____
|Directory Opus                                 | o |
|---------------------------------------------------|
| Subpath [optional]                                |
| Filename                                          |
|                                                   |
| Source: Path of the Source Lister                 |
| File Length bytes, File Time, File Date           |
| Library Base Name Version.Revision (Version Date) |
| Version Comment [optional]                        |
| File Comment [optional]                           |
|                                                   |
| Destination: Path of the Destination Lister       |
| File Length bytes, File Time, File Date           |
| Library Base Name Version.Revision (Version Date) |
| Version Comment [optional]                        |
| File Comment [optional]                           |
|_____|
|
                  repl. Dest

                  repl. Source

                  skip
              |
  ---------------------------------------------------------
```

1.18 ersetze Ziel

The file in the destination lister will be replaced by the file from source
lister.

1.19 ersetze Source

The file in the source lister will be replaced by the file from destination
lister.

1.20   auslassen

Neither the file in the source nor the file in the destination will be
copied or overwritten.

1.21   complete Source/Destination

                   If a file does not exist in
                    source
                   /
                    destination
                   , it will automatically be
copied from
                    destination
                   /
                    source
                    to
                    source
                   /
                    destination
                    .

Default: On for
                    destination
                   , off for
                    source
                    .

1.22   compare Icons

                   Not implemented yet.
It scans both icons and compares type, stack, default tool and tooltypes
and will warn you, if there are differences.
Icons are only completed or skipped for now.

You can enable this function by clicking with the left mouse button on
the
                    yes
                    button to the right of the 'compare icons' field.

You can disable this function by clicking with the right mouse button on
the
                    no
                    button to the right of the 'compare icons' button.

1.23   Enable 'compare Icons'

                   Enables the
                    compare Icons
                    routine.

1.24   Disable 'compare Icons'

                    Disables the
                     compare Icons
                     routine.

1.25   !! Install !!

                    Starts the installation program,
                     Install_Startup.dopus5
                    . You need a
                     source
                    and a
                     destination
                     or you have to give two extra
                     parameters
                    . Files
can be selected in
                     source
                     or
                     destination
                    , it doesn't matter.
The program will open a new lister for both
                     source
                     and
                     destination
                     so
that your original
                     source
                     and
                     destination
                     won't get busy.
The new listers will be hidden immediately and closed before the program
ends.
Depending on the functions you've set, a
                     requester
                     will
ask you what to do.

It is possible to run this program several times at once.

You can stop it by pressing ctrl-c in the output window.

In the output window there are the following messages. They are always related
to the filename that follows on the same line:

[REPL D] Replacing
                     destination
                     file.
[REPL S] Replacing
                     source
                     file.
[SKIP A] File has been skipped as the user selected
                     skip

```
                     .
[COPY D] Copying file from
                source
                to
                destination
                     .
[COPY S] Copying file from
                destination
                to
                source
                     .
[SKIP D] The file would have been copied to
                destination
                if

                complete

                destination
                had been activated.
[SKIP S] The file would have been copied to
                source
                if
                complete

                source
                        had been activated.
[SKIP= ]
                Source
              - and
                destination
                files are the same.
[SKIP.e]
                Icon compare routine
                would have been used if it were implemented.
[SKIP. ] The files were not compared as they are icons and the

                icon compare routine
                is disabled.
[SKIPnr] As
                replace

                source
                and
                replace

                destination
                are disabled, the
        files have been
                skipped
                     .
[ASK dD] Although the
                destination
                file should have been

                replaced automatically
              , the user will be
                asked
```

```
                                  as it was delete protected.
[ASK dS] Although the
                    source
                    file should have been

                    replaced automatically
                  , the user will be
                    asked
                                  as it was delete protected.
[ASK   ] The user will be
                    asked
                    and he can choose between
                    replace Destination

                    replace Source
                    and
                    skip
                    .
[ASK  D] The user will be
                    asked
                    and he can choose between
                    replace Destination
                            and
                    skip
                    .
[ASK  S] The user will be
                    asked
                    and he can choose between
                    replace Source
                            and
                    skip
                    .
[ASK  ?] An unexpected case has occured and the file was
                    skipped
                    .
```

1.26 !! Install >libs: !!

```
            This is an example button how you could use this program from  ←
               filetypes.
Look at
            the arguments list of Install_Startup.dopus5
            .
```

1.27 Internals

```
            Multitasking/Ports

            Parsing of the localized output of c:version full file

            Command line options of Install_Preferences.dopus5
```

Command line options of Install_Startup.dopus5

1.28 Multitasking/Ports

There are seven tasks running at the same time and communication ←↩
over ports.
- DOINST.x Install_Startup.dopus5
  Only runs before and after Install_Main.dopus5
- DOINMN.x Install_Main.dopus5
  Controls all other tasks
- DOINSS.x Install_Scan.dopus5
  Scans source directory for files and dirs.
- DOINSD.x Install_Scan.dopus5
  Scans destination directory for files and dirs.
- DOINVS.x Install_GetID.dopus5
  Scans the source files for
                crc
                and version string.
- DOINVD.x Install_GetID.dopus5
  Scans the destination files for
                crc
                and version string.
- DOINEX.x Install_Execute.dopus5
  Copies and replaces the files told by the main program.
- DOINRQ.x Install_Request.dopus5
  Opens the
                requester
                to find out which file you want to replace.
As this program completely multitasks, you don't need to answer the
                requester
                when it appears. The program will continue to work.

1.29 reset to defaults

Sets the default settings. These are

WRITECOMS
                write Comment to source

                on
            WRITECOMD
             write Comment to destination

                on
            REPLACES
             replace files on source

                on
            REPLACED
             replace files on destination

```
                 on
         NOAUTOREPLACES
          auto replace files on source

          off
         AUTOREPLACED
          auto replace files on destination

          on
         NOCOMPLETES
          complete source directory

          off
         COMPLETED
          complete destination directory

          on
         NOCICONS
          compare icons

          off
         BASE
          compare BaseName
         VERSION
          compare Version
         SIZE
          compare FileSize
         VDATE
          compare VersionDate
         FDATE
          compare FileDate
```

1.30 Parsing of the localized output of c:version full file

```
The output of the version command is different in each country. Some examples:
Kickstart 40.70, Workbench 40.42 (18.02.1994) (Switzerland)
Kickstart 40.70, Workbench 40.42 (18-Februar-1994) (Italy)
Kickstart 40.70, Workbench 40.42 (02/18/94) (USA)
After starting my program, it checks wheter the ENV:sys/locale.prefs has
changed. If yes, a parsing table is built and saved in DOpus5:System/
Install_Locale.prefs.
The program should understand all date formats! :-)
```

1.31 Functions

```
         By pressing either yes (left mouse button) or no (right mouse  ←
            button) in the
column under the
          source
          or the
          destination
         button, you can either enable or disable the corresponding  ←
            function.
```

```
write Comment

replace

auto replace

complete
```

1.32 Source

By pressing either yes (lmb) or no (rmb) in the column under the
 source
button, you can either enable or disable the corresponding ←
    function.

```
write Comment

replace

auto replace

complete
```

1.33 destination

By pressing either yes (lmb) or no (rmb) in the column under the
 destination
button, you can either enable or disable the corresponding ←
    function.

```
write Comment

replace

auto replace

complete
```

1.34 Enable 'write Comment to Source'

```
Enables the
 write Comment
 routine for the
 source
  .
```

1.35   Enable 'write Comment to Destination'

```
Enables the
 write Comment
 routine for the
 destination
 .
```

1.36   Disable 'write Comment to Source'

```
Disables the
 write Comment
 routine for the
 source
 .
```

1.37   Disable 'write Comment to Destination'

```
Disables the
 write Comment
 routine for the
 destination
 .
```

1.38   Enable 'replace File on Source'

```
Enables the
 replace File
 routine for the
 source
 .
```

1.39   Enable 'replace File on Destination'

```
Enables the
 replace File
 routine for the
 destination
 .
```

1.40   Disable 'replace File on Source'

```
                    Disables the
                     replace File
                     routine for the
                     source
                     .
```

1.41 Disable 'replace File on Destination'

```
                    Disables the
                     replace File
                     routine for the
                     destination
                     .
```

1.42 Enable 'auto replace File on Source'

```
                    Enables the
                     auto replace File
                     routine for the
                     source
                     .
```

1.43 Enable 'auto replace File on Destination'

```
                    Enables the
                     auto replace File
                     routine for the
                     destination
                     .
```

1.44 Disable 'auto replace File on Source'

```
                    Disables the
                     auto replace File
                     routine for the
                     source
                     .
```

1.45 Disable 'auto replace File on Destination'

```
                    Disables the
                     auto replace File
                     routine for the
                     destination
                     .
```

1.46   Enable 'complete Source Directory'

```
Enables the
 complete Directory
 routine for the
 source
.
```

1.47   Enable 'complete Destination Directory'

```
Enables the
 complete Directory
 routine for the
 destination
.
```

1.48   Disable 'complete Source Directory'

```
Disables the
 complete Directory
 routine for the
 source
.
```

1.49   Disable 'complete Destination Directory'

```
Disables the
 complete Directory
 routine for the
 destination
.
```

1.50   auto replace if...

```
If every of the following criteriums

 same BaseName

 Version higher

 VersionDate higher

 Size greater

 FileDate higher
is either true or disabled, Install.dopus5
```

```
                       automatically replaces
                       the
older file if this function is enabled, otherwise it opens a
                       requester
                       if
the
                       replace
                       function is enabled, otherwise it skips the file.
```

1.51   same BaseName

```
                   If this function is enabled, Install.dopus5 will check wheter both ←
                       file have
the same BaseName. If not, no file will
                   automatically be replaced
                    .

Default: On.

Example:
> version libs:cybergraphics.library full file
cybergraphics.library 40.107 (25.02.1997) © by Vision Factory Development
^^^^^^^^^^^^^^^^^^^^^
This is the BaseName (the string in front of the version number)
```

1.52   Version higher

```
                   If this function is enabled, Install.dopus5 will check the version ←
                       numbers.
If both files have the same
                    version
                    but not the same
                    crc
                   , a
                    requester
                    will
ask you what to do.
If one file has the higher
                    version
                    and the other
                    criteriums
                    are either true or
disabled, the file will automatically replace the older if
                   auto replace
                   is enabled.

Default: On.
```

1.53   VersionDate higher

```
                  If this function is enabled, Install.dopus5 will check the
                   version date
                  .
If both files have the same
                   version date
                   but not the same
                   crc
                  , a
                   requester
                  will ask you what to do.
If one file is newer and the other
                   criteriums
                   are either true or disabled,
the file will automatically replace the older if
                   auto replace
                   is
enabled.

Default: On.
```

1.54   Size greater

```
                  If this function is enabled, Install.dopus5 will check the
                   file sizes
                  .
If both files have the same size date but not the same
                   crc
                  , a
                   requester
                  will ask you what to do.
If one file is bigger and the other
                   criteriums
                   are either true or disabled,
the file will automatically replace the smaller if
                   auto replace
                   is
enabled.

Default: On.
```

1.55   FileDate higher

```
                  If this function is enabled, Install.dopus5 will check the
                   filedates
                  .
If both files have the same
                   age
                   but not the same
                   crc
                  , a
                   requester
```

```
                will ask you
what to do.
If one file is newer and the other
                criteriums
                are either true or disabled,
the file will automatically replace the older if
                auto replace
                is
enabled.

Default: On.
```

1.56   ignore FileDate

```
          Disables the
           higher FileDate criterium
          .
```

1.57   ignore VersionDate

```
          Disables the
           higher VersionDate criterium
          .
```

1.58   ignore Size

```
          Disables the
           greater Size criterium
          .
```

1.59   ignore Version

```
          Disables the
           higher Version criterium
          .
```

1.60   ignore BaseName

```
          Disables the
           same BaseName criterium
          .
```

1.61   Command line arguments of Install_Startup.dopus5

```
PORT/A,SOURCEHANDLE/A,DESTINATIONHANDLE/A,PREFSFILE/A,FILE,DESTINATION

PORT               - {Qp} (Directory Opus Port, required)
SOURCEHANDLE       - {Ql} (current source lister handle)
DESTINATIONHANDLE - {Qd} (current destination lister handle)
PREFSFILE          - DOpus5:System/Install_Main.prefs, required
FILE               - {o} only needed if you use it from a popup menu
DESTINATION        - eg 'libs:' only needed if you use it from a popup menu
                     in this case, a destination lister is not required
```

1.62   Command line arguments of Install_Preferences.dopus5

```
                PORT/A,PREFSFILE/A,SHOWSETTINGS/S,WRITECOMS/S,WRITECOMD/S,REPLACES ←
                    /S,
REPLACED/S,AUTOREPLACES/S,AUTOREPLACED/S,COMPLETES/S,COMPLETED/S,CICONS/S,
SIZE/S,FDATE/S,VDATE/S,BASE/S,VERSION/S,NOWRITECOMS/S,NOWRITECOMD/S,
NOREPLACES/S,NOREPLACED/S,NOAUTOREPLACES/S,NOAUTOREPLACED/S,NOCOMPLETES/S,
NOCOMPLETED/S,NOCICONS/S,NOSIZE/S,NOFDATE/S,NOVDATE/S,NOBASE/S,NOVERSION/S

PORT            - {Qp} (Directory Opus Port, required)
PREFSFILE       - DOpus5:System/Install_Main.prefs, required
SHOWSETTINGS    - Shows the current settings in a
                 requester
              You can use all of the following arguments for Install_Preferences ←
                 .dopus5
with the prefix 'NO' to disable the corresponding option:

                WRITECOMS
                  -
                Write comment
                to
                source
                directory

                WRITECOMD
                  -
                Write comment
                to
                destination
                directory

                REPLACES
                  -
                Replace files
                on
                source
                directory

                REPLACED
                  -
                Replace files
```

```
                         on
                         destination
                         directory

                         AUTOREPLACES
                           -
                         Auto replace files
                         on
                         source
                         directory

                         AUTOREPLACED
                           -
                         Auto replace files
                         on
                         destination
                         directory

                         COMPLETES
                           -
                         Copy files
                         to
                         source
                         directory

                         COMPLETED
                           -
                         Copy files
                         to
                         destination
                         directory

                         CICONS
                           -
                         Compare icons

                         SIZE
                           - One file must be bigger than the other to auto replace the  ←
                             other

                         FDATE
                           - One file must be newer than the other to auto replace the  ←
                             other

                         VDATE
                           - One file must be newer than the other to auto replace the  ←
                             other

                         BASE
                           - The base name must be the same to auto replace the other

                         VERSION
                           - The file must have a higher version to auto replace the other
```

1.63   crc

                      The
                       crc
                       is a 32 bit checksum. It's calculated by reading every byte of a ←
                          file
and adding them in a certain way. It's save to assume that two files with the
same name, size and
                      crc
                      are the same.
As comparing byte for byte in ARexx would take a lot of time, it's much faster
to have a library calculating the
                      crc
                      . And if
                      write Comment
                      is enabled,
the program will be much faster the second time you use it on the same files
as the
                      crc
                      is already calculated and can be read from the file's comment.
As some program (CynnusEd, ...) are saving files by keeping the comment line,
the
                      crc
                      must be verified with the AmigaDOS filedate and the filedate that
was written to the comment field with the
                      crc
                      and the version string.
That's why there are always 16 hex characters in the comment and not only the
8 characters for the
                      crc
                      .
