Chapter 1

MaxManager - Known bugs

1.1 MaxManager - Known bugs

Known bugs in MaxManager

As every program, MaxManager is not perfect (yet :-)) and due to development process got some known bug unfixed. Below you can find the list of them and solutions how to workaroud them harmless until I fix them. All listed bugs are not critical and won't cause system crash nor database damage, but may be annoying. Sorry.

* Section To Drawer Attachments

The bugs appears while you want to remove the path from inside the list while having some attachments made makes MaxManager to mess all already set attachments. The only safe workaround so far is to detach all attachments and then remove the section.

* Pathes

It's rather required to end all non temporary pathes (e.g. in program settings) with colon or trailing slash depending on path itself. In some cases it's required by MAX's (e.g. when you add new path with Prefs/Pathes/Attachment editor - take care it ends with "/", or ":")

Problems with pathes may sometimes appears when using ASL filerequesters to change existing paths. Sometimes there's part of old path left in the result string (it doesn't happen when there's "/" or ":" at the end).

Finally MaxManager will care about this, but for now it can sometimes ommit these sitation, which may drive to small problems.
