Welcome to MXMClock

MXM Clock 1.1 is © 1992 -1993 by Matthew Xavier Mora
it is freeware but not considered Public Domain.

This is a Clock Application that draws a clock in the menubar at idle
 time. It requires 32bitcolor quickdraw and multifinder.

How to change the Clock Preferences:

Open the resource called "CLCK" in this resource you will see seven
items.

ClockRect
This is the rectangle that the clock will be displayed in. The clock is
is displayed left justfied in the rectangle. You will need to make this
larger if you increase the font size. Be warned that the larger you make
this   rectangle the more memory you will need to display the clock.
You might need to give the app more memory for larger clock
rectangle.

FontNum
This is the font number to use for the display.

FontSize
This is the size of the font.

BaseLine
This is where the baseline of the font appers in the rectangle. Leave it
at 0 if you want it to calculate where it should go. If you don't like where
it puts it, you can enter the pixel location of where you want the baseline.

Sleeptime
This is the waitnextevent value for the amout of time MXMClock should
yeild while its in the background. You will probably want to set it to
below 60 if you want to display the seconds. The time entered is in ticks
(60ths of a second)

Wants Secs
Click either true or false if you want to show the seconds.

Clock Offset
With version 1.1 MXM clock now keeps an offset to the right edge
of the menubar so that when moving between systems of monitores it still will display in
th ecorrect area.
