—

acintosh:

We can render your Electric Image files.   You can send us a project file
including all of the texture maps, background picture's, etc. which we will
render and output to videotape.   We can also provide you with a backup
tape in 8mm Exabyte or 4mm DAT format of the rendered files.

We also provide the service of rendering and/or outputting your files in
Abekas format to Exabyte 8mm tape, which can then be read directly into
an Abekas recorder.

Silicon Graphics:

If you are working with a program that outputs files (single files or
animations) in RIB format for MacRenderMan, we can render them on our
Silicon Graphics 4D/35 TG Workstation.   The SGI renders RIB files roughly
10 times faster than the Quadra 900.
