Strawman Framework

- ☐ One analysis of the problem
 - ☐ Available as *draft-zorn-roamreq-00.txt*
- ☐ Related Work

Example Problem

- ☐ Fred has signed up for Internet access with ISP A in his local area.
- ☐ ISP A has joined an association of other ISPs (which we will call ISPGROUP) in order to offer service outside the local area.
- ☐ Fred travels to another part of the world, and wishes to dial into a phone number offered by ISP B (also a member of ISPGROUP), possibly retaining his IP address from ISP A.

Problem Breakdown

☐ Phone number presentation

- ☐ Fred must be able to find and select the phone number offered by ISP B

☐ Phone number exchange

- ☐ When there is a change in the status of phone numbers, there must be a way for providers in ISPGROUP to notify each other and propagate the changes.

☐ Phone book compilation

- ☐ When these updates occur, there must be a way to compile a new phone book for ISP A, based on the submitted changes.

☐ *Issue: are policy-based phonebooks necessary?*

Problem Breakdown (cont'd)

☐ Phone book update

- ☐ Once a new phone book is compiled, there must be a way to update Fred's phone book.

☐ Connection management

- ☐ Fred's machine must be able to dial the phone number, successfully connect, and interoperate with the Network Access Server.

☐ Authentication

- ☐ Fred must be able to secure access to the network.
- ☐ One approach: use of RADIUS/TACACS+ authentication proxies and “realms”, I.e. use of fred@ispa.com as userID in PPP authentication.

Problem Breakdown (cont'd)

❑ NAS Configuration/authorization

❑ The Network Access Server (NAS) must receive configuration parameters in order to set up Fred's session.

❑ *Issue: RADIUS/TACACS+ servers may send network specific parameters not relevant to ISP B*

❑ **Solution: RADIUS/TACACS+ proxies can shield servers from network specific knowledge by inserting/modifying parameters**

Problem Breakdown (cont'd)

Security

- ❑ If desired, additional security measures should be supported for Fred's session. These could include use of token cards, or tunneling.
- ❑ Requires definition of token card attributes
- ❑ *Issue: if security attributes are requested, modification by proxies may be problematic*

Routing

- ❑ Fred may wish to retain the IP address given to him by ISP A
- ❑ Through tunneling, this can be supported
 - ❑ symmetric tunneling
 - ❑ asymmetric tunneling

Problem Breakdown (cont'd)

Accounting

- ISP B must keep track of what resources Fred used during the session: time, speed, ISDN/modem, etc.
- Many accounting protocols in use
 - SNMP, RADIUS, syslog, TACACS+, etc.
- Not clear that accounting protocols need to be standardized for this purpose, just accounting record formats, and transmission protocols.

Related Work

- ❑ NAS protocols
 - ❑ RADIUS, TACACS+, etc.
- ❑ IP mobility
 - ❑ routing
- ❑ Tunneling
 - ❑ PPTP, L2F, etc.
