# Server Evolution in the Java™ Paradigm

*Dennis Tsu  
Director, Internet  
Product Marketing,  
SMCC*

# Java Infrastructure

---

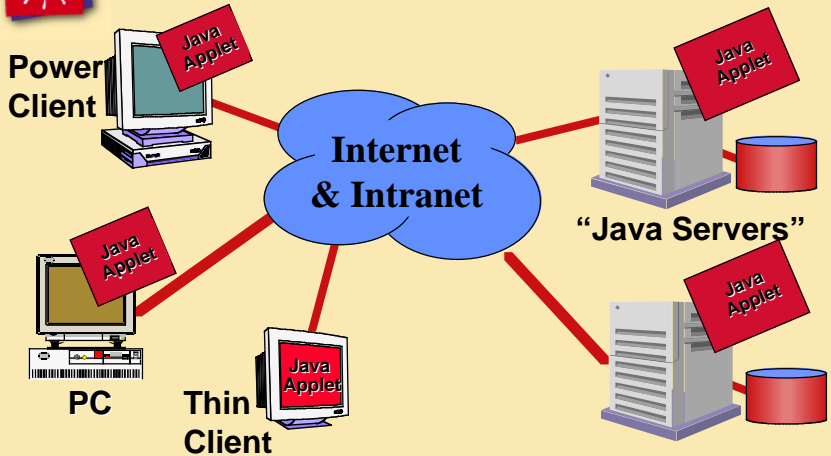

# Agenda

---

- Introduction/Objectives
- Java Network Computing
- Applet “Servers”
- Thin Client “Servers”
- Applet “Catchers”
- Competitive Landscape
- Summary

# Java Network Computing

# Applet Servers

# Applet Servers

---

- Key Requirements
  - performance, scalability
  - reliability (RAS)
  - ease-of-use, manageability
  - integration with applet authoring, creation tools
- Products are shipping today
- Next Steps
  - more, better, cheaper, faster...

# Thin Client Java Servers

# Thin Client Expectations

---

- Multiple “thin clients” will ship in CY96:
  - “network computer”
  - cellular phone
  - 3270 replacement
  - set top box
  - PDAs
  - tablets
  - etc....

# Java Server for Thin Clients

---

- **Support for the client at “power up”**
  - providing the necessary information/software
  - will vary — based on clients’ capabilities
- **Operational support**
  - Performance
  - Tracking status (State machine)
- **NMS**
  - reporting
  - billing
  - etc.

# Java Server for Thin Clients

---

- **Configuration/Performance**
  - will vary based on number/type of clients
  - anticipate a range of needs
- **Minimal system target**
  - 10 clients (@\$800) = \$8k
  - 1 server = \$4k to \$5k ?
- **Large system target**
  - 1000 clients (@\$600) = \$60k
  - 1 server = \$40k to \$60k ?

# Thin Client Java Server

## *Phase One Features*

---

- **Client Installation**
  - Assign Network ID
  - Assign default application
  - Assign client State Files
- **Client Administration Facilities**
  - Client Statistics
  - User Statistics
  - Network Statistics
- **User Administration**
  - Add/Modify/Delete Users
  - Assign default home page
  - Assign User State Files
- **Boot Facilities**
  - Installation and Administration of Boot Images
  - Boot Protocol Support

# Thin Client Java Server

## *Stage 2 & beyond*

---

- Intermittently connected clients
  - keep state information for clients who may only log on for minutes per day
  - clients may also process applets while they are disconnected
- Roaming, nomadic clients
  - track clients across the network, maintain linkages to the appropriate server/applets/data

# Thin Client Java Server

## *Potential Customers/Applications*

---

- Financial Services Institutions
- Health Care Industry
- Telco's
- Publishers
- Cellular Data Services Providers
- CATV Companies
- Maintenance Workers/Mechanics
- Package Delivery/Distribution/Postal Services
- Governmental Agencies
- Java applet distribution

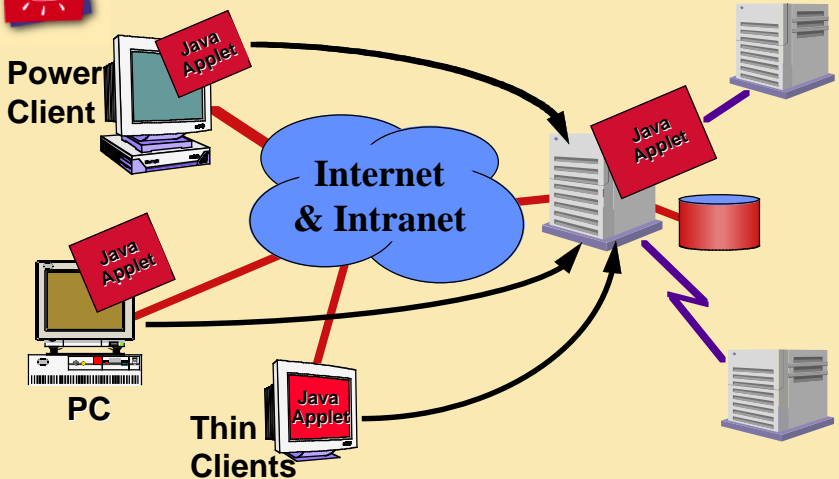

# Thin Client Servers

---

- Key Requirements
  - performance/scaleability
  - network connectivity
  - security, ease of use
  - integration with clients
  - reliability (RAS)
  - manageability
- Product Availability
  - in conjunction with thin clients

# Applet "Catchers"

# Applet Catchers

---

- Key Requirements
  - performance, scalability
  - connectivity
  - reliability
  - manageability
  - security, ease of use
  - ease of applet creation
  - legacy application connectivity
- Product Availability — CY97

# Competitive Landscape

---

- Java endorsed by everyone
- Hot market, highly competitive
- Internet years = dog years
- > 6 thin clients by year end
- Java Server Selection:
  - Hardware vs. Software vs. Bundles
  - Single vendor vs. multi-vendor
  - Open vs. Proprietary

## Summary

---

- CY96 = applet servers (today) & thin-client servers (by year-end)
- CY97 = applet catchers
- Competitive differentiators:
  - performance, scalability
  - network awareness, connectivity
  - degree of integration, ease of use
  - security, management
  - reliability, availability, serviceability
