

This is the Read Me document for version 0.8b1 of Apollo, the launching utility. The complete set of files for version 0.8 is as follows:

Apollo	the system extension itself
Eagle	a background application used by Apollo (system 7 only)
Apollo converter	a utility to transfer menu settings from earlier versions of Apollo into v0.8
About Apollo...	full documentation for Apollo (aMacWrite document)
Quick intro	quick introduction to Apollo (a MacWrite document)
About Eagle...	documentation for Eagle (a MacWrite document)
About Converter...	documentation for Apollo Converter (a MacWrite document)
Conflicts	a list of conflicts between Apollo and other programs (a MacWrite document)
0.8 Read Me	this document
Version history	a brief history of improvements and bug fixes (a THINK C TEXT document)

If you are not running system 7, you do not need the Eagle files.

I suggest that you read at least the Quick intro document before doing anything with Apollo.

Please note that 0.8b1 is a beta release of Apollo. I think that it is free of bugs, but I cannot guarantee it. I use it daily and it hasn't crashed on my Mac for ages. If you discover any bugs, or have any suggestions for improvements to Apollo, please let me know. Thank you.
