

ovaLink is a multi-line, multi-user information server that combines all the features of traditional bulletin board software and new capabilities. As a server, NovaLink Professional can handle up to 20 incoming phone lines and 24 AppleTalk™ network connections.\* The structure and appearance of the server is completely customizable. Your server's form and function are restricted only by your imagination. NovaLink Professional supports a new, entirely windowing interface with NovaTerm 2.0, that allows the Mac user to access your server the point-and-click, windowing, Macintosh way. Unlike other graphic-based servers, NovaLink Professional provides extensive support for VT-100 (ANSI) emulation, including color. You can also write your own external applications in C or Pascal to extend the power and scope of your server. The chapter entitled "NovaLink Professional 2.0" contains a more detailed feature list on all the capabilities of NovaLink Professional.

Before its official release NovaLink Professional 2.0 had more than 50 testers around the world. It has undergone extensive development and testing and has been successfully used in several test commercial applications. There is a file library on NovaCentral that contains what you need to visit a few of these servers.

Res Nova's main server, NovaCentral, acts as an information center on our products. The chapter on "NovaTerm" 2.0 explains how to call NovaCentral and what to expect. You can call it with any terminal emulation software at (714) 840-8641 (300 to 9600 Baud). Calling with NovaTerm 2.0 is explained in more detail in the chapters on "NovaTerm 2.0" and "Calling NovaCentral". If you have not already downloaded NovaTerm from NovaCentral or any of the other on-line services, we suggest you do so to proceed with this electronic preview.

NovaCentral also acts a meeting place for all NovaLink server operators and the experts from Res Nova. When you call it using NovaTerm 2.0 you will be able to ask questions directly to Res Nova, or its customers. It is definitely the best way to get answers about any of our products.

About Res Nova Software

Res Nova Software, Inc. has been in business since 1989. Our first program, Nova Link™, was released by its authors through shareware distribution in 1987. Since then the program has undergone extensive expansion and testing which have culminated in the recent release of our first commercial product, NovaLink Professional 2.0. NovaLink Professional 2.0 is the server software of choice for many popular servers around the United States and the world that offer technical support, on-line purchasing and a wide variety of other services.

\* The number of serial nodes is limited by the number of serial ports and CPU processor speed. The actual number of AppleTalk nodes will vary depending on Macintosh model, network configuration and available memory.
