WinLink User Manager Help

Supplied with WinLink is the program USERMGR.EXE.   Operation of the program is reasonably self-evident.   A user is automatically entered into the USERS.APS file upon the first logging in.   A call may also be entered directly with the User Manager.

The User Editor

Parameters

There are a number of parameters that may be set for any given user using the WinLink User Manager.   Here is a list, click on a word for its meaning:

MBO   Protected   Expert   Lockout   Last Message   Last Bulletin   Last Login

MBO - Set this for any station that you directly auto forward traffic to on HF.   This enables that station to read <u>any</u> un-canceled message in your system in order to obtain fills.   It also enables the RF and RI commands.

Prevents removal of the station from the file when the Purge command is used.

Sets EXPERT mode for a user.

Prevents the indicated call from logging into your system on any port.

The **Last Message** and **Last Bulletin** parameters cannot be changed except to set them to zero with the zero command.   These two parameters determine what number the message and bulletin lists begin with.

Shows the time and date of the last time the indicated call logged into the system.

The **Purge** command removes all calls from the file that have not logged in within the last 180 days.
