## Revision History:

### Version 1.0 - Initial Release

### Version 1.01 - Several bug fixes and enhancements made to the program.

1. The "C Runtime Error" no longer occurs in the Polar FFT.
2. The "Samples" and "Seconds" menu selections were added to the edit menu to allow display of cursor, window, and other locations in samples or in seconds.
3. A vertical scale has been added to show normalized sample values. The scale can be turned off from "Scale" selection on the edit menu.
4. FFT data is now saved with a waveform or FFT file to rescale waveform to correct values, and to eliminate spurious "Waveform is not an FFT..." messages when saved FFT's are read back from disk.
5. Cleaned up the code that inverts the selection to eliminate stray vertical lines while making or changing a selection.
6. Added "NOISE" to the "WAVE" menu.

### Version 1.02 - A few more fixes and enhancements made to the program

1. "New" from the file menu does not give a "C Runtime Error" anymore.
2. An UNDO feature has been added. Major operations now save a copy of the waveform prior to updating it.
3. Cleaned up the double-click bug when the "Open" dialog box is displayed and the user double-clicks on a file to open it. This used to select part of the wave after the dialog box was displayed in V1.0.
4. WaveEdit now closes files after reading them, so SHARE does not complain about attempting to access a file that is already open.
5. Cleaned up the insertion bug with items in the "WAVE" menu.

### Version 1.03 - More cleanup and new features

1. Some of the Menu have been rearranged. "Reverse", "Volume" and "Echo" now appear under the "Transforms" menu.
2. A new filter has been added. This filter produces a line segment approximation of the waveform. See the HELP file for an explanation of how it works.

3. Correct version numbers now appear in the right places.
4. The HELP file has been updated to reflect the latest changes.
5. Several minor bugs were eradicated.
