MenuWait external 1.3

MenuWait is an external function for use with QuicKeys 2. When used in a sequence (the only place it is useful) it will pause the sequence until a menu item you select matches check mark and enable criteria you set up.

By clicking on the "Select Menu" button you are put in a mode that allows you to select an item from any menu at the top of the screen, like the standard QK menu QuicKey. The menu name and item name will then be displayed in the dialog box.

You then choose whether you want the item to be CHECKED, NOT CHECKED, or that you DONT CARE. You also choose whether you want the item to be ENABLED, DISABLED, or that you DONT CARE.

The sequence will stay paused until the status of the menu item matches the preferences you set in the dialog (exactly).

To install the MenuDecision external, use CE Software's Extension Manager, and follow their instructions for its use.
