Program use.

This is a shareware product. You may use it for 30 days. If after 30 days you would like to continue using this program you must purchase the licensed version.

In this way you can obtain the latest version for free and you can help the author to continue improving the program with news features.

I would appreciate suggestions and ideas. Contact me without problems.

For more informations read the main help.

Hint Configuration

Show Hint

With **Options** you can Show or Hide the Hint when you stop your mouse over a control. Check or Uncheck the box how you need.

When you check **Show Hint** you can also set the Hint properties.

Hint Pause

Set the pause until the Hint appear.

Hint Color

With this control you can set the background color of the Hint.

Personal INI configuration file.

Personal INI configuration file

Here you can put your own personal configuration file.

When you set new **Personal INI configuration file** the global INI file of the application is copied into new INI file.

In this situation every change of application configuration is made in your personal INI files. This is useful when you have a Network environment and you want to have only one program with several configurations. For example the program is located in **g:\winapps\app\app.exe** and configuration file is located in local disk **c:\windows\apps.ini**.

Search Personal INI configuration file

If **Personal INI configuration file** already exists you can choose it with this control.

Register the program, please.

Software Registration.

Last Update 11/10/1996 Jrgs3

Register the program.

In the Software Registration Panel you can register this program. If, after a training period, you want to use it, you could have a registration code.

Software Registration Panel

In the **Complete name** you must write the registration name. Be careful, the name is **case sensitive**.

In the **Registration code** you have to put your assigned code in this format **xxx-yyyy-zzz**.

In **Notes** you can write your own notes like **this is for internal use only..** and so on.

If everyting is all right, all shareware limitations will disappear.

Jsmtp Auto mail.

Last Update 16/10/1996 Main

Hi, I am an Italian programmer and this is my first application in English version. (Now I mean this bad translation, you think...)

I beg your pardon for mistakes you will find in this application.

If you can help me, for a right expression, I can register the program for free .

Before you begin and Configuration.

Last Update 16/10/1996 ConStr2

Brief explanation of the program.

Jsmtp Automail is a program to send mail via SMTP protocol to Internet/Intranet server in automatic mode.

It runs under Windows 3.x over standard WinSocket like Trumpet or others. It is totally configurable.

You can use this program in interactive or in batch mode via on line command parameters.

At the first time, you have to configure the application with the default parameters. If you use Netscape Navigator (r), you can read this options from Netscape INI file.

You have to put in at least **Your Server** and **Your Email** in the **SMTP default options** or check **Read from Netscape** if this is installed on this PC. (The program check if exists).

After this you are able to send the first Email message. See next section.

First configuration.

Fields Explanation :

SMTP Default Options

Mail Server	Mail server Name or IP Address to connect to.
Your Email	Your own Replay Email.
Your Name	Your Last and First Name. (You can left this field blank)
Organization	Name of your organization if exists. (You can left this field blank)
Read from Netscape	Read all previous values from NETSCAPE.INI (the program test if exists)
Debug transmission	Open a monitor where I can see the SMTP transaction.
Subject	Set the default Subject of the message. (You can left this field blank)
Mail To	Set the default list of destination mail. You can set only one address or multiple addresses separated by comma.
From file	Read the default body of the message from this file. You can search the file throught the directory by the button on the right of this field.
Delete the file...	Set, if you want delete the file, at the end of transmission or not
HTML message head	You can set the message head in HTML format. The body of message must be in HTML format. I can try this features only with Netscape 2.x or greater.

Getting started.

Last Update 16/10/1996 ConStr3

After the configuration.you can set other default options, like your Name and your organization.

You can set the default message option wich you can change in interactive mode or override via on line command parameters

You can send messages in HTML format for those Mail Readers wich support this format (Netscape navigator)

You can delete the message file at the end of transmission in automatic mode. (Used often in batch mode)

In Interactive mode you can edit the message file before the transmission.

After this :

In Interactive mode try this...

Write the Email destination and click the **send** button. In the SMTP monitor you can see the sending in progression.

In Batch mode try this...

In the program manager add this parameters to the program command line:

...jsmtp /b /to:[your favourite Email] where [your favourite Email] is the destination address.

Es. **jsmtp /b /to:iaco@idgroup.it** to send the mail to me

For more informations read on line command parameters or read the hint over every field in the program.

On Line command parameters.

Last Update 16/10/1996 ConStr4

With **on line command parameters** you can send the mail in batch mode. There are several options explained in the following section.

Remember that the **on line parameter** takes precedence over the default section. You can see the origin of settings in the main panel of the program, in the **settings coming from** by the flag **[C] [N] [O]**.

[C] Means that this setting is coming from Default configuration.

[N] Means that this setting is coming from Netscape INI file.

[O] Means that this setting is coming from on line command.

You can use several switches. Remember that the command line is limited at 128 characters. The parameters **are** case sensitive.

Switch	Explanation
/b	Execute Jsmtip Automail in batch mode, with default parameters and/or on line command parameters. Example
/d	Delete the file to send at the end of transmission. Example
/html:[switch]	View or not, the mail in <u>HTML</u> format if the file is in this format. The valid switches are : 1 or yes or true for activation and 0 or no or false for deactivation (I tried this features only with Netscape 2.x) Example
/host:[host name]	Override the default host with this new value. Example
/from:[Email Sender]	Override the default own Email. Example
/mfile:[File Name]	Override the default message file to send. The file must be in text format and cannot be longer than 32k. The file can also be formatted in <u>HTML</u> format see the switch /html:yes . Example Example
/to:[Destination list]	Override the default destination Email address/addresses. You can insert multiple Email addresser with a comma delimiter without blanks . Example
/subject:[Title]	Override the default subject text message with new title. The subject must be without blanks. Example

If you need some more parameters please contact me.

Referring always to the last version of the program.

Email to [me](#) for more informations before beginning the work.

Example: **jsmtp /b /to:iaco@idgroup.it /subject:Happy_birthday_to_you**

Start the program, send the message with the default settings to the author of the program with the **"Happy_birthday_to_you"** subject and then return to the system. Remember that the text of the subject must be without blanks.

Example1: **jsmtp /b /to:iaco@idgroup.it**

Start the program, send the message with the default settings to the author of the program and than return to the system.

Example2: **jsmtp /to:iaco@idgroup.it,mc3551@mclink.it,bill@msn.com**

Start the program, set the destination list to **iaco@idgroup.it,mc3551@mclink.it,bill@msn.com** and than go in interactive mode.

Example: **jsmtp /from:gone.it**

Start the program, set new own Email address and go in interactive mode. This is useful when you want to use this program in a Network with only one installation.

Example: **jsmtp /host:xnet.it**

Start the program, set new host address and go in interactive mode.

Example: **jsmtp /b /html:yes /mfile:c:\windows\temp\index.htm**

Start the program, send the mail where the body is the c:\windows\temp\index.htm file with HTML head and then return to the system. In the Netscape Navigator you can see the mail like a Web page.

Example: **jsmtp /b /d /mfile:c:\windows\temp\message.txt**

Start the program, send the mail where the body is the c:\windows\temp\message.txt file, than delete the file and return to the system.

Example: **jsmtp /b**

Start the program, send the mail with the default settings and return to the system.

HTML means **Hyper Text Markup Language**. This language is used to write Web pages in Internet.

SMTP means **Simple Mail Transfer Protocol**. Usually when you write the mail to the Intranet/Internet server you use this protocol. Refer to your Internet provider or to Network administrator.
