

I do not know what the gasoline prices on non - german territory are alike, but maybe this program could come in handy also for users in other european countries. In germany, the administration has raised takes on gasoline recently, so that you always have to watch your gas gauge. This is for environmental reasons and for squeezing money out of the motorist. The environmental aspects can be supported with this little program that calculates the average gasoline consumption. You also get an overview over the other car costs. Here are some translations for your convenience:

„Kraftstoff“ = „gasoline“

„Versicherung“ = „insurance“

„Wartung“ = „maintenance“

„Raten“ = „interest rates“

„Sonstiges“ = „other“

I left out a taxes column, because administration in germany is now converting the car tax to a pollution tax of which it is not quite clear at the time how it will be paid. Besides, as I am informed, car taxes are not raised in the US.

If you want to copy it to others, always copy the files „vb40032.dll“, „olepro32.dll“ and

„msvcrt40.dll“. And write me an email: knips-ko@reze-1.rz.rwth-aachen.de

All other programs that I made (everything is freeware), can be downloaded from the web URL:
