## **InstallSHIELD Script Cracking (best viewed under 800x600 with WordPad)**

<b><u>CONTENTS:</u></b>	<b>A) INTRODUCTION</b>	(It´s only an Intro )
got these Tools	<b>B) TOOLS YOU WILL NEED</b>	(Well i think most of ya )
that you read this before D	<b>C) WHAT WE ARE DEALING WITH</b>	(I recommend )
way	<b>D) FIRST APPROACH</b>	(The Alternate )
Cracking !!!	<b>E) SECOND APPROACH</b>	(Script )
Installation	<b>F) ADDON</b>	(Common InstallSHIELD )
help you	<b>G) WIN32.HLP</b>	(Disscriptions that will )
need to read this	<b>H) LAST WORDS</b>	(Maybe ya dont )
hehe !!!!!	<b>I) GREETINGS</b>	(Don´t miss this Part, )

---

---

### **A) INTRODUCTION**

I welcome you to my first Cracking Tutorial and I will try to write more Tutorials in the Future.

I could have made more in the past, but i was afraid if

anybody could read my **BAD English ;)**  
so please excuse me and just try to follow me.

**LEVEL :** Well, I will try to give you all Informations and document all my Steps and Listings, so maybe also a Beginner will understand this Tutorial (maybe ;). As I told you the only Problem you will maybe have is my bad bad English ,hehe.

**TARGET :** Our Target is **Cakewalk HomeStudio from Twelve Tone Systems ,**

I have got it from Kirk\_Hamm in #Cracking(EFNET)  
THANX !!! =)

- a Person I dont really know ,he was just req the Crack.  
The File contains not the whole App by the way, just all the necessary Files to get the Installation running.  
The compressed File size is only 536 KB, so if you want it just msg me on Efnet or Email me and i will send ya the File if iam not busy =).

**PROTECTION :** This App has 3 Protections.

- 1.CD-CHECK**
- 2.CD-KEY**
- 3.SERIAL**

---

## **B) TOOLS YOU NEED**

You will need the following Tools:

- **SoftICE 3.x** from Numega (The best Debugger. Big Thanx to Numega )
- **W32Dasm 8.9** from URSoft (I love References )
- **Hex-Workshop** or any other **Hex-Editor** (Yeah, gimme the Bytes location )
- **Icomp** the **InstallSHIELD de/compressor** (Thanx to Lord Caligio that he has put it on his Page)
- A Martini and/or a cigarette if ur a +Cracker ;)

You can get all these Tools from **Lord Carligo's Web-Page**. One of the best Cracking Resource i ever have seen before by the way !!!

**<http://cracking.home.ml.org/>**

---

### **C) WHAT WE ARE DEALING WITH**

After unzip'ing the File into **C:/TEMP** there are the following files:

<b>_SETUP.LIB</b>		<b>151 KB</b>
<b>_SETUP.EXE</b>	<b>659</b>	<b>KB</b>
<b>_SETUP.DLL</b>		<b>5,98 KB</b>
<b>_SETUP.INS</b>	<b>89,5</b>	<b>KB</b>
<b>SETUP.PKG</b>		<b>Not important</b>

(There are a lot more files in the complete App)

Let me first explain what we got here.

These are the typical Files from a InstallSHIELD Installation. **\_SETUP.LIB** is a **compressed Data-Base** from InstallSHIELD. It can contain **exe's and dll's** supporting the Installation. Sometimes these Support Files are in the same dir like SETUP.EXE (unlikely), but in our case they are compressed into **\_SETUP.LIB** (You will see later).

What that person from #Cracking didn't send me was the compressed Data-Base Files (xxx.1-x,xxx.z) containing the App Files and so they can be very big ;).

Don't mind it , because we dont need them anyway for cracking.

A **compressed Data-Base File** allways begins with "**13 5D 65 8C 3A 01 02 00**", so if you cant find any xxx.z or xxx.1-x then just look for these bytes.

At the End of every compressed Data-Base File you can see all the

File Names by the way.

**SETUP.PKG** contains all the **File-Names** in the App Data-Base which we

dont need and so we dont need SETUP.PKG either.  
InstallSHIELD uses SETUP.PKG to refer the Files in the App  
Data-Base  
in the copying process i believe.  
Anyway, we dont need it, so lets go on.  
**\_SETUP.DLL** is a **InstallSHIELD Resource DLL** and its  
not important for us,  
because its only a Support File which is supplied with any  
InstallSHIELD Installation.  
**SETUP.INS** is the **compiled Installation Script** and its  
the most important Part in a  
InstallSHILED Installation Process !!!.  
In Win95 it has got a globe connected to a phone as icon.  
This File Controls any Action and has got most of the  
messages of the  
Installation and it will play a major Role in our SECOND  
APPROACH.  
**SETUP.EXE** is the head of all , its the **Installation Engine**  
and **executes the Script** and does all  
**calls to DLL's and Disk-Access (32 Bit !!!)**.  
So far so good, now we know much more about  
InstallSHIELD =)  
Lets start with the....

---

## **D) FIRST APPROACH**

### **(CD-CHECK)**

**ASSUMPTION :** I assume the following things **under SoftICE :**

```
F5="^x;"
F7="^here;"
F8="^t;"
F9="^bpx;"
F10="^p;"
F11="^G @SS:ESP;"
F12="^p ret;"
```

Also the **winice.dat** File in your SoftICE dir should contain :

**EXP=c:\windows\system\kernel32.dll**  
**EXP=c:\windows\system\user32.dll**

**HINT :** "\*" in Front of the Text coming up means, that the **text into brackets** must be **typed under SoftICE!**

**START :** Ok, now lets get to business and start cracking.  
First we just start the Installation (SETUP.EXE) and see whats happening.

Well, a **MessageBox** tells us, that "**Setup must be run from the original CD**".

Our next logical step now should be setting a **Breakpoint on**

**GetDriveTypeA** ("A" coz SETUP.EXE is a 32 Bit App).  
Have a look at part **G) WIN32.HLP** of this tutorial to get more info about **GetDriveType** !!!

\* We press Ctrl+D and SoftICE pops up and then we type in "BPX GetDriveTypeA"

\* Pressing "Ctrl+D" ("F5") gets us back to Windows, where we start Setup.exe again.

Ok, we are in SoftICE before the MessageBox appears.  
We are in the Kernel32 at GetDriveTypeA, so lets get out of here

\* by pressing "F11" one time. And now we are in **INSHELP**, damn !!! whats that ? it wasnt in our dir !!

\* Well i typed in "MOD INSHELP" to get more info about this file

and SoftICE shows me, that its located in :

**C:\TEMP\\_ISTMP0.DIR\INSHELP.DLL**

Now we see that it's a DLL and that InstallShield has created a **Temporary directory** called **\_ISTMP0.DIR** and then it puts the file INSHELP.DLL in there. But where this File comes from ?

Ok, maybe you dont have forgotten what i told you in **C)** about

**compressed Data-Bases** ? Yes ? Then you should read it again now !!!!

So this DLL must be in **\_SETUP.LIB**, but how should we patch it ?

Well we got **ICOMPX** the **InstallShield de/compressor** ;)

Let's decompress **\_SETUP.LIB** ("**ICOMP \_SETUP.LIB \*.\* -d -i**")

These Files we will get :

**INSHELP.DLL**  
**UNINST.EXE**  
**\_ISRES.DLL**

The **last two files** are only **support Files** and not important for us.

What we know now is that **INSHELP.DLL** makes the **CD-CHECK** and that it is in **\_SETUP.LIB** which we can decompress and then compress again.

By the way you may just type in "**ICOMP**" to get the **full usage**.

Now that we got all infos about this File and how to patch it lets

go on with SoftICE´ing ;).

We are still in **INSHELP.DLL**, so let me give you the listing

first :

**Your adresses may differ in the first four diggits !**

**(relocation)**

**And SoftICE pops up at 100011A0 (0) , so go there**

**now !!!!**

#### **DWORD TABLE:**

:10001308 BA120010	DWORD 100012BA	These
are the DWORDS for the <b>indirect jmps</b>		
:1000130C C7120010	DWORD 100012C7	I
have place them here coz it will be		
:10001310 D4120010	DWORD 100012D4	
easier for you to follow me ;)		
:10001314 E1120010	DWORD 100012E1	
:10001318 EE120010	DWORD 100012EE

last byte(s)
:10001190 C644244B00       mov [esp + 4B], 00  |-----"C:\
TEMP\"
:10001195 8D4C2448         lea ecx, [esp + 48]  <----- "C:\"
= RootPathName
:10001199 51                push ecx             Handle it
to GetDriveTypeA

```

**\* Reference To: KERNEL32.GetDriveTypeA, Ord:00CEh**

```

|
:1000119A FF15E0900010           Call dword ptr [100090E0]      This
calls GetDriveTypeA (return: eax=Type)
:100011A0 83F806           cmp eax, 00000006           <-----
    (0) SoftICE breaks in here !!!
:100011A3 0F8704010000       ja 100012AD                 (1)
:100011A9 FF248508130010       jmp dword ptr [4*eax + 10001308] (2)
:100011B0 8D442414           lea eax, [esp + 14]         (3)
:100011B4 6A32             push 00000032
    FileSystemNameSize
:100011B6 8D4C2414         lea ecx, [esp + 14]
:100011BA 50                push eax

```

```

lpFileSystemNameBuffer
:100011BB 8D542414      lea edx, [esp + 14]
:100011BF 51                push ecx
      lpFileSystemFlags
:100011C0 8D442414      lea eax, [esp + 14]
:100011C4 52                push edx
      lpMaximumComponentLength
:100011C5 8D8C2420010000lea ecx, [esp + 00000120]
:100011CC 50                push eax
      lpVolumeSerialNumber
:100011CD 8D54245C      lea edx, [esp + 5C]
:100011D1 68C8000000     push 000000C8
      VolumeNameSize
:100011D6 51                push ecx
lpVolumeNameBuffer
:100011D7 52                push edx
      lpRootPathName ("C:\")

```

Ok, we are right after the GetDrivetypeA call.

Let us first figure out what will happen if we trace further.

**(1)** This conditional jmp will never happen if i can trust on

the

Disscription of GetDriveType.

**(2)** My eax is 3 (Hard-Disk) so this ptr will be

$3*4+10001308=10001314$

so this jmp would lead us to **100012E1 (see the DWORD**

**TABLE above !)**

```

:100012E1 33C0           xor eax, eax                Set eax to
0
:100012E3 5F             pop edi
      Restore edi from stack
:100012E4 5E             pop esi
      Restore esi from stack
:100012E5 81C4E8020000  add esp, 000002E8
      Delete temporary Stack-Frame
:100012EB C20400        ret 0004                    return

```

Well it seems that **EAX=0** stands for **BAD BOY ;)**

**Cracking this CD-CHECK could end here just by  
patching the instructions**

**at the Start of this routine (10001160)...**

**Original:**

```

:10001160 81ECE8020000  sub esp, 000002E8
      Create a temporary Stack-Frame

```

```

:10001166 B9FFFFFF      mov ecx, FFFFFFFF
      ecx=FFFFFFF
:1000116B 2BC0           sub eax, eax           eax=0
:1000116D 56             push esi              Save esi
:1000116E 57             push edi              Save edi

```

**Change to:**

```

:10001160 33C0           xor eax,eax           eax=0
:10001162 40             inc eax
      eax=eax+1=1 GOOD BOY
:10001163 C20400        ret 0004              Return

```

**Search for "81ECE8020000"** in INSHELP.DLL with your Hex-Editor.

You will only find one location (Offset 560). **Replace the bytes with "33C040C20400"** and **save it**.

Ok, and now **compress it back into \_SETUP.LIB**. Just type in **"icomp inshelp.dll \_setup.lib"** and **dont delete INSHELP.DLL**,

because we will need it again later ;)

**Do you want to know what this CD-CHECK would do further on ?**

**If not just go over to the (CD-KEY) Section below !!!**

\* Hmmm, so you wanna learn more about CD-CHECKS ;) OK What we do now is setting eax to 5 by typing in "r eax=5" then the jmp will bring us to  
dptr[5\*4+10001308]=dptr[1000131C]=100011B0  
which means we are right after the jmp itself ! at **(3)**  
The instructions after **(3)** just pushes all the infos for the GetVolumeInformationA call at 100011D8.

**\* Reference To: KERNEL32.GetVolumeInformationA, Ord:013Ah**

```

      |
:100011D8 FF15DC900010    Call dword ptr [100090DC]    This
calls GetVolumeInformation
:100011DE 85C0           test eax, eax               Do we got
all infos?
:100011E0 0F8481000000    je 10001267                 (4) if yes
goto 10001267
:100011E6 8D842410010000  lea eax, [esp + 00000110]
      Volume Name ("HD_C")

```

**\* Possible StringData Ref from Data Obj ->"CWHS\_601"**

```
|
:100011ED B938600010          mov ecx, 10006038
```

**\* Referenced by a (U)nconditional or (C)onditional Jump at Address:  
|:1000120C(C)**

```
|
:100011F2 8A10          mov dl, [eax]          Here it
compares my Volume Name "HD_C"
:100011F4 3A11          cmp dl, [ecx]          with
"CWHS_601"
:100011F6 751A          jne 10001212          (5) Bad jmp !
:100011F8 0AD2          or dl, dl
:100011FA 7412          je 1000120E
:100011FC 8A5001        mov dl, [eax+01]
:100011FF 3A5101        cmp dl, [ecx+01]
:10001202 750E          jne 10001212          (5) Bad jmp !
:10001204 83C002        add eax, 00000002
:10001207 83C102        add ecx, 00000002
:1000120A 0AD2          or dl, dl
:1000120C 75E4          jne 100011F2
```

**\* Referenced by a (U)nconditional or (C)onditional Jump at Address:

```

:10001035 C3

ret

Return

Setup calls a **Sub in INSHELP** while **initialisation**, which sets the **dword [10006030] to 1 !!!**

OK, we just have learned something more about CD-Protections under Windows95 ;)

**- INSHELP first checks if setup is running from a CD-ROM.**  
**- Then it checks the Volume Name and the File System.**  
**- And at least it just checks for a specific File "setup.lib".**  
**- After all INSHELP will return "1" for OK and "0" for Error !!!**

**This CD-CHECK is defeated, now lets face the....**

### **(CD-KEY)**

Ok, the MessageBox never appears now, we get a Welcome Window instead ;)

We get an Edit area and a Text telling us to enter the **13 diggit CD-KEY** ,brbrb.

**Breakpoint on**

\*

easy hehe ;)

\*

press "F11".

**length**

be

**We type in "1234567890123"** and then i set a

**GetWindowTextA** : "BPX GetWindowTextA".

After pressing the **NEXT-> Button** SoftICE pops up, this is

We are in GetWindowTextA so lets get back to the App and

I looked at **EAX**, because it always **contains the Text**

**GetWindowTextA returns,**

but hell !!!! this isnt the length of my Text and so this cant

my Text =(, brb.

**Dont worry, this is just a little trick to prevent Beginners to crack it.**

**There are lotta other App out there using this trick btw !**

**Setup uses GetWindowTextA** to retrieves our input, but

it dont wait for

the user pressing NEXT->, it just gets the text **anytime we type in a single letter,**

\* so lets first disable our Breakpoint : "BD 0",  
and then **we type in "12345678901234"** and then we

enable our Breakpoint :

\* "BE 0".(dont forget to leave SoftICE)

with back-space So, now comes the truth. I just deleted the last number

leave here

\* again by pressing "F11".

Well, this looks much better, because **EAX=0D=13, yeah our Key-lenght ;)**

We are **in Setup** by the way. Right after the Call  
GetWindowTextA

there is a **"LEA EAX,[EBP+FFFFFFBF4]"** which will let **EAX points to our Text,**

\* so trace over it with "F8" or "F10".

\* Do a "D EAX" and you will see our text "1234567890123" !!

\* ok lets delete our Breakpoint, because we got what we  
wanted : "BC \*".

And now we set a **Breakpoint on Memory Access on our text loaction :**

\* "BPM EAX". Ok, exit SoftICE and it will fast pop up again.

SoftICE will break into different locations, but the one that  
is important for us is the **IstrcpyA.**

You will land in there **at the following instructions :**

```

...          .....
REPNZ      SCASB          <-----SoftICE will
break in here !!!
NOT  ECX
MOV  ESI,[EBP+0C]          This is our
old location
MOV  EDI,[EBP+08]          This will be
our new location
...          .....

```

So, **if you see these instructions** you can **delete your old breakpoint,**

\* **trace over the 2 MOVS** with "F8" and then **set a new**

**Breakpoint on EDI:**

\* "BPM EDI". **Otherwise just leave SoftICE** until you are

**back in the**

into IstrcpyA  
**Breakpoints**,  
before,  
first  
SoftICE (relocation).

**Installation Window.** Press **NEXT->** and you will break several times again, but now **dont delete the old** just **set the new ones on EDI** after the 2 MOVs like until you are in **INSHELP !!!! yeah its the same dll ;).** Let me give you the listing first and consider again that the four digits of the adresses may differ from yours under

**SoftICE will break in at 10001377 !!!**

**Start of this routine:**

```

:10001350 83EC34          sub esp, 00000034
    Create a temporary Stack-Frame
:10001353 53                push ebx          Save ebx
:10001354 56                push esi          Save esi
:10001355 57                push edi          Save edi
:10001356 E8D5FCFFFF        call 10001030     Was this
routine initialised ?
:1000135B 85C0             test eax, eax     Check ok ?
(It will be)
:1000135D 750B             jne 1000136A     then goto
1000136A, else
:1000135F 33C0             xor eax, eax      Set eax=0
BAD BOY !!!
:10001361 5F                pop edi
    Restore edi
:10001362 5E                pop esi
    Restore esi
:10001363 5B                pop ebx          Restore ebx
:10001364 83C434          add esp, 00000034
    Delete temporary Stack-Frame
:10001367 C20400          ret 0004         Return

```

Well it seems that **EAX=0** stands for **BAD BOY again like in the CD-Check !!**

**Cracking this CD-KEY could end here just by patching the instructions**

**at the Start of this routine (10001350)...**

**Dont patch it yet, if you wanna learn how to reverse engineer this KEY-Protection !!!!**

**Original:**

```

:10001350 83EC34          sub esp, 00000034
      Create a temporary Stack-Frame
:10001353 53          push ebx          Save ebx
:10001354 56          push esi          Save esi
:10001355 57          push edi          Save edi
:10001356 E8D5FCFFFF      call 10001030     Was this
routine initialised ?

```

**Change to:**

```

:10001350 33C0          xor eax,eax      eax=0
:10001352 40          inc eax
      eax=eax+1=1 GOOD BOY
:10001353 C20400          ret 0004         Return

```

**Search for "83EC34535657"** in INSHELP.DLL with your Hex-Editor.

You will only find one location (Offset 750). **Replace the bytes with "33C040C20400"** and **save it**.

Ok, and now **compress it back into \_SETUP.LIB**. Just type in "**icomp inshelp.dll \_setup.lib**" and **dont delete INSHELP.DLL**,

because we will need it again later ;)

**And now any KEY you type in will be valid, cool heh =)**

**Do you wanna learn how to reverse this CD-KEY**

**Protection ?**

**If not just go over to the (SERIAL) Section below !!!**

Ok, lets go on with this routine...

**\* Referenced by a (U)nconditional or (C)onditional Jump at Address:**

**|:1000135D(C)**

```

|
:1000136A 8B5C2444      mov ebx, [esp + 44]      ebx

:1000142F 5F              pop edi
:10001430 5E              pop esi
:10001431 5B              pop ebx
:10001432 83C434         add esp, 00000034
:10001435 C20400         ret 0004

```

To reverse engineer a KEY-Check i start at the end of the routine.

I mean where the final check occurs !!! This will happen at line **(18) 100013F4**.

Here **ecx** must be **D050**. Now lets go back to the previous line.

Here ecx will be **subtracted by E11 the App-ID**, this means **ecx must be D050+E11=DE61**

at this point !!!!

Now let us see what the instructions at **(16)** does !

Well, let me first extract the few lines from 100013C8 - 100013EB into a more comfortable format

for you :  
**(1000,100 and 10 are in decimal ; numbers are in  
asc-II !!!)**

**ecx=( ( (1. number) \* 10 + 4. number ) \* 10 ) + 5.  
number ) \* 10 ) + 6. number**

After simplification we get :

**ecx=1. number \* 1000 + 4. number \*100 + 5.  
number \*10 + 6. number**

Hmm, now we know how ecx is calculated, but **whats  
D050 ?**

Well, if we typed in **"0"=48=30h** as our 1.,4.,5. and 6.  
number, then we will get :

**ecx=30h \* 1000d + 30h \* 100d + 30h \* 10d + 30h =  
D050 !!! =)**

And now consider that **E11 h=3601 d= 3 \* 1000d + 6 \*  
100d + 0 \* 10d + 1 !!!**

**Now guess what our 4 numbers are ;) !!!  
Yes, thats right...**

**the 1. number must be 3 !!!  
the 4. number must be 6 !!!  
the 5. number must be 0 !!!  
and the 6. number must be 1 !!!**

**So our KEY is build like this  
"3xx601xxxxxxx" ,hehe !!!**

Ok, lets look back before **(16)**  
**(14)** This will call a sub at **10001440** which will **calculate  
a code** with our KEY.

**(15)** This code will be **compared with E7B37 !!!**  
If this compare fails we will land at **(20) 1000142D BAD  
BOY !!!**

Let us first examine the sub which generates the code...

:10001440 56	push esi	Save esi
:10001441 33D2	xor edx, edx	edx=0
:10001443 57	push edi	Save edi
:10001444 33C9	xor ecx, ecx	ecx=0, this

will be our char position counter

```
:10001446 8B74240C      mov esi, [esp + 0C]      esi
will point to our KEY
:1000144A 380E           cmp [esi], cl           Is the KEY
empty ?
:1000144C 7419           je 10001467            If yes goto
10001467 and return with code=0
```

**\* Referenced by a (U)nconditional or (C)onditional Jump at Address:  
|:10001465(C)**

```
|
:1000144E C1E206      shl edx, 06            (21)
edx=edx*2^6=edx*64d=edx*40h
:10001451 BFE1D61200    mov edi, 0012D6E1
edi=12D6E1
:10001456 0FBE040E     movsx byte ptr eax, [esi + ecx] (22)
get next number from our KEY
:1000145A 03C2         add eax, edx
eax=eax+edx
:1000145C 41           inc ecx
ecx=ecx+1, counter +1
:1000145D 2BD2         sub edx, edx           edx=0
:1000145F F7F7         div edi               (23)
eax=eax/edi, edx=mod (eax/edi)
:10001461 803C0E00     cmp byte ptr [esi + ecx], 00
Reach end of KEY ?
:10001465 75E7         jne 1000144E          If not goto
1000144E
```

**\* Referenced by a (U)nconditional or (C)onditional Jump at Address:  
|:1000144C(C)**

```
|
:10001467 8BC2         mov eax, edx          (24) eax=edx,
the code !!!
:10001469 5F           pop edi
Restore edi
:1000146A 5E           pop esi
Restore esi
:1000146B C20400      ret 0004              return
```

To reverse this sub we must start at the end of it at line  
**10001467 (24) !!!**

**eax=edx is the code and it must be E7B37 (15) !!!**  
**(23)** Here we see that E7B37 is mod (eax/edi) = mod  
(eax/12D6E1)

**(22)** Well, this is shit !!!, because we will loose information

(eax) by each loop.

What we know is that eax will be clipped after every 4 number, because...

$$30*40*40*40+30*40*40+30*40+30=C30C30 >$$

**12D6E1**

Thus we can set a **seed KEY "3xx6x1yyyyyyy"**, where x can be any number and y will be the corrections. First go back to Setup and choice a **seed KEY !!!**

I used for example **"3006010000000"**.

To get a valid KEY let us **Brute-Force-Crack** this babe =) Its not the best way, but this code generating part is short, thus it will be executed fast.

Trace to the location at line **100013C1 (15)** where the code will be compared with E7B37.

Trace over it to the next line **100013C6** and then we have to code a little procedure.

\* EBX is unused, so we will use it **as counter. Type in "r ebx=0"**.

\* Now type in "a" and let us add a little procedure, which will find a valid KEY for us.

Please adjust the addresses yourself, since this will be typed directly into memory !!!

* goto GO_ON	"JNZ	GO_ON"	Not a valid KEY,
* FOUND&FAIL:	"NOP"		This will be our
Stop Point			
* GO_ON:	"CMP	EBX,1312CFF"	Check only
numbers from 0-19999999 !!!			
* *	"JZ	FAIL"	Yes, goto FAIL
our KEY	"MOV	ESI,[ESP+C]"	ESI points to
* *	"MOV	EAX,EBX"	EAX=EBX
* *	"MOV	ECX,A"	ECX=A=10d
* CONVERT_DEC:	"XOR	EDX,EDX"	EDX=0
* EDX=MOD (EAX/ECX)	"DIV	ECX"	EAX=EAX/ECX,
* *	"ADD	DL,30"	EDX=EDX+"0"
NUMBER INTO KEY	"MOV	[ESI+C],DL"	STORE
* the previous number	"DEC	ESI"	ESI will point to

<p>* completed ?</p> <p>* CONVERT_DEC</p> <p>* KEY !</p>	<p>"CMP      EAX,0"      Conversion</p> <p>"JNZ      CONVERT_DEC" If not goto</p> <p>"JMP      100013B7"      Check this</p>
--	--

The comparison at GO\_ON makes sure that the App-ID will not be manipulated !!

\* Ok, you typed in all this mess ;) Now you must **clear all Break-Points** "BC \*"

\* and then set a **Break-Point on execution** on line **FOUND&FAIL !!!! "BPX <your adress>"**.

Now leave SoftICE and wait.....  
SoftICE will pop up at **FOUND&FAIL**, so first **check EAX**, it should be **E7B37** !!!

\* If yes, you can get your KEY with **"D [ESP+C]"**.  
I have found **"3006010147046"** for my seed KEY ,btw =)

\* **To get out of this Loop set your EIP to 1000142D "r eip=1000142D" and clear all Break-Points !!!**  
**Then leave SoftICE, and you will be back in Setup. Cancel it and then start it again and use your valid KEY !!!**

**Summarize:**

- KEY must contain 13 numbers.
- KEY has got 4 fixed numbers **"3xx601yyyyyyy"**. Its the App-ID (3601), which may differ in other App from Twelve Tone Systems. Setup handles this App-ID to INSHELP before he calls it.
- yyyyyyy can be found with Brute-Force-Cracking.

**This Protection is defeated, lets go over to the...**

**(SERIAL)** \_\_\_\_\_ Well, the KEY was a little bit tricky, heh ? Anyway you are here now to face the Serial !!!

Setup asks for a **User-Name, Company and Serial**, so lets type in sum crap.

I typed in "NaTzGUL" as User-Name, "REVOLT" as Company and "1234567890" as Serial.

Please proceed with the Serial like in the KEY Section !!!!  
You will land into Setup !!!!, damn the Script is doing the

Check, brbrb.

I gave up !!! There are just too many push,pop and calls, believe me, try it out !!!

To defeat this Protection we need a new method !!!

---

---

## **E) SECOND APPROACH**

**ASSUMPTION:** I assume that you have partially read the first Approach and that the App (INSHELP) is unpatched in any way !!!! (Original state !!! you may uncompress the whole App again !).

**INTRO:** Zen !!! yeah, thats what we need =)  
As i told you in our first approach **SETUP.INS** is the main part of a InstallSHIELD Installation !!!  
SETUP.INS is a **compiled Script**, this means before compilation it may have the following basic instructions :

- "IF,THEN,(ELSE)"
- "GOTO"
- "CALL"
- "RETURN()"
- "LOAD","OPEN","CLOSE"
- "MESSAGEBOX"
- etc.

To decrypt the whole mnemonic back to its instructions is not necessary to crack this app,  
so i though that the most **important** instruction should be the **"IF,THEN"** one. It should occure very often in the Script and it may have the following syntax :

**IF cmp THEN....**

**cmp = (arg1) compare\_type (arg2)**

**arg1** is a variable, **arg2** can be a variable or a constant (two constants makes no sense ,of coz !).

the **compare\_type** can only be one of these six types :

**Type:**

**Corresponding jmp:**

LOWER-EQUAL	JLE
GREATER-EQUAL	JGE
LOWER	JL
GREATER	JG
NOT-EQUAL	JNE
EQUAL	JE

**A compiled COMPARE instruction could look like**

**this :**

**Compare\_mnemonic,result,Byte\_A, arg1 , Byte\_B, compare\_type, Byte\_C, arg2**

**Byte\_A is refering arg1, Byte\_B gets the compare\_type and Byte\_C is refering arg2 and also says if arg2 is a variable or constant.**

You maybe have realised , that there are some mnemonic 's are missing.

As i mentioned this instruction should **occure very often** in **SETUP.INS**, so i examined the file for this **byte structure** and me found out :

**>>>>> COMPARE mnemonic (actualy 128) !!!**  
 | | |  
**28,01,32,result\_var,Byte\_A, arg1 , Byte\_B, compare\_type, Byte\_C, arg2**

**following Byte\_A="B"=0x42 means variable\_index(word) is**

**following Byte\_B="A"=0x41 means constant (dword) is**

**Byte\_C="A"=0x41 if comparing with a constant**  
**Byte\_C="B"=0x42 if comparing two viriabies**

**result\_var = type of word (variable\_index)**  
**arg1 = type of word (variable\_index)**  
**compare\_type = type of dword (1-6)**  
**arg2 = type of word (variable\_index) or dword**  
**(constant)**

**Example : lets say we have found the following bytes .**

**28,01,32, 03,00, 42, 01,00, 41, compare\_type, 42, 02,00**

This will compare a variable with index 0x0001 and a variable with index 0x002 with the specific compare\_type and then stores the result (0/1) of this comparison into the variable with index 0x003.

Now what we need are the type of comparisons, hmm how should we obtain them ?

**Setup is executing this Script**, so there is the place we have to search for them !!!

I **W32dasm** Setup.exe and searched for the place where **compare\_type** gets compared with **1-6** and i found them at line **0043C89B**.

```

**Ok, let us summerize the compare\_types :**

<b>jmp:</b>	<b>Type:</b>	<b>math.exp.:</b>	<b>Coresponding</b>
	<b>Compare Type (dword):</b>		
1	LOWER-EQUAL	<=	JLE
2	GREATER-EQUAL	>=	JGE
3	LOWER	<	JL
4	GREATER	>	JG
5	NOT-EQUAL	!=	JNE
	EQUAL	=	JE

**MESSAGEBOX byte structure :**

\_\_\_\_\_2A,0,61,length(word),text will show a **messagebox with the specific text !!!**

**Since the compare part of an IF-THEN instruction is what we really need for our interest you could now go directly to the START further below !!!**

Otherwise learn more about other instructions and how they are build up =)

**The structure of a compiled IF-THEN instruction may look like this :**

**COMPARE , BRANCH\_TO location IF !(result - arg\_x)**

**(result - arg\_x)** will be zero if they are equal else it will be not zero.

The result comes from the comparision and arg\_x can be a variable or a constant.

Now we come to the **IF-THEN** byte structure :

**COMPARE-structure,BRANCH\_TO\_mnemonic,I\_index, SUB, Byte\_A,result,Byte\_C,arg\_x**

**BRANCH\_TO\_mnemonic = 22,0,70**  
**SUB = 95 (in an IF-THEN instruction !!!)**

**Byte\_A="B"=0x42 result of comparision will**  
**always be a variable\_index**  
**Byte\_C="A"=0x41 arg\_x always will be a constant**  
**in an IF-THEN instruction !!!**

**I\_index = type of word (index)**  
**result = type of word (variable\_index)**  
**arg\_x = will be a dword (constant)**  
**=0x00000000 in an IF-THEN instruction !!!**

**The branch location will be an offset into the script**

and it is calculated like this :

**location = dword [ I\_index\* 6 + Branch-Table-Offset+2]**

**Location-Table-Offset = Offset "\_EWQ"**  
**;in this script it was 14546 !!!**

**Just search for "\_EWQ" and you will find it ( Its linked at the end of the script )!!!**

**GOTO byte structure :**

\_\_\_\_\_ **2C,00,70,I\_index**

**There are more instructions i have decrypted, but we dont need them for this tutorial.**

**Its quite easy to write a Decompiler with this information and if you have found out the location where Setup is executing the script then its not that hard to see what it is doing depending on the mnemonic, but thats another story and this tutorial is damn big enough !!!**

Now we can try out our first Script-Cracking attempt =)...

**START:**

**(CD-CHECK)** \_\_\_\_\_ **First think about how this check was written with the Script instructions !!**

The easiest way may be done like this :

**(Assume: Return\_of\_INSHELP=0/1 (BAD/GOOD) !!! )**

**arg1=CALL(INSHELP,CD-CHECK)**  
**IF arg1 = 0 THEN MESSAGEBOX "Setup must be run from the original CD":END**  
**ELSE RETURN(1)**

or this...

**arg1=CALL(INSHELP,CD-CHECK)**  
**IF arg1 != 0 THEN RETURN(1)**  
**ELSE MESSAGEBOX "Setup must be run from the original CD":RETURN(0)**

**After compiling** this pice of code, the bytes would look

like this :

```
28,01,32,"B",arg1 (word),"A",6 (dword),"A",0  
(dword),...,2A,0,61,27 (word),"Setup must be..."
```

or this...

```
28,01,32,"B",arg1 (word),"A",5 (dword),"A",0  
(dword),...,2A,0,61,27 (word),"Setup must be..."
```

\_\_\_\_\_ I have retrieved this part of **SETUP.INS** for you....(**Offset 8D70**)

```
arg1_Variable_index (word) < < >  
compare_type_5 !!!  
result_Variable_index (word) <<<| | |  
IF mnemonic <<<<< | | | | |  
00008D70 9A FF 42 2D 00 28 01 32 2D 00 42 9B FF 41 05 00  
..B-.(.2-.B..A..  
00008D80 00 00 41 00 00 00 00 22 00 70 53 01 95 42 2D 00  
..A....".pS..B-  
00008D90 41 00 00 00 00 2A 00 61 27 00 53 65 74 75 70 20  
A...*.a'.Setup  
00008DA0 6D 75 73 74 20 62 65 20 72 75 6E 20 66 72 6F 6D  
must be run from  
00008DB0 20 74 68 65 20 6F 72 69 67 69 6E 61 6C 20 43 44  
the original CD
```

We see that its **compare\_type\_5 (!=)**, so we just have to  
**change it into 6 (=)**  
**at Offset 8D7E** to defeat this CD-CHECK, isnt it easy !!!

**BTW, if you are using the patched INSHELP, this  
change will reverse  
the result from INSHELP, so dont use the patched  
INSHELP !!!!!!**

**(CD-KEY)** \_\_\_\_\_ I **seeked SETUP.INS** for the bytes **2A,0,61** and found the  
**CD-KEY** notification part  
at **Offset 8FD0**

```
00008FD0 42 00 00 28 01 32 2E 00 42 2D 00 41 02 00 00 00 B..
```

```

```

Change **Offset(904C) to 6** and this KEY-Protection will be history,hehe !!!

You can now type in anything you want and it will be valid.  
 BTW, if you also change Offset(8FDC) to 4 it will also accept an emty KEY !!!

**(Serial)** \_\_\_\_\_ Ok, now we will see if this Script-Cracking will defeat this damn Serial-Check !

This **Check dont use INSHELP** or any other DLL. It **strickly uses the Script !!**

This means we cant expect a simple compare\_type\_5 or 6 before its messagebox !

There is no other way than using our beloved **SoftICE a bit !**

To see what Setup is comparing when he checks the Serial we must first **type in**

**User-Name,(Company) and a Serial.** I used **"123456789" as Serial.**

Now invoke SoftICE with its hotkey (Strg+D) and make sure you are in Setup's

Adress-Context ("Setup" in the right, bottom egde) , otherwise leave SoftICE

and invoke it again until you are there. If you are in the Kernel or User API just

\* trace back with "F12" until you are in Setup !!!

\* Set **BPX on 0043C89B** "bpx 0043C89B" the **entry point**

**of the compare part !!!**

Now leave SoftICE and press **NEXT->** .

SoftICE will pop up at 0043C89B several times and Setup will perform comparisions !

**Here is my history of the comparisions :**

	<u>Comparisions:</u>	<u>Compare_type:</u>	
important	(1) 0 != 1	5	Not
important (chr-position counter?)	(2) 0 >= 3	2	Not
like our Serial-length !!!	(3) 9 <= 0	1	This looks
first char of our Serial !!!	(4) 61 > 31	4	Well, its the
is checking if it is	(5) 7A < 31	3	and it setup
"a"- "z", "A"- "Z", "0"- "9"	(6) 41 > 31	4	between
	(7) 5A < 31	3	
	(8) 30 > 31	4	
	(9) 39 < 31	3	

(10) 3 <= 0 1 Not  
important(chr-position counter?)  
BREAK.

It seems that it checks every char from our serial  
seperately.

Since our Serial is not valid lets fake this check !!!  
(3) This really looks like a char position pointer, which is  
compared to our serial length.

We have to reverse this compare to get out of this check !!!  
Here is the hex dump...

```

```

If you have change the byte at **(3) offset (63BE) to 2** you will get to the final check.

**(11)** Setup will finally check if 13 chars of your serial were valid !!!

Just change byte at **(11) offset (653D) to 5** and this Serial check will be defeated !!!

### **Summarize:**

You see now that Script Cracking is much easier than the first approach !!!

We only have to search for MessageBoxes and analyze the script.

At all we only have to edit (patch) the script and thats all =)

If i find out more instructions then you even will be able to get a valid Serial(Keymaker) !!!

A Decompiler will follow anyway. Its only a question of time when it will

be written so watch out for it,hehe.

---

---

## **F) ADDON**

This part will disscribe the most common InstallSHIELD Installation.

If **Setup.exe (InstallSHIELD 2.x)** is a **16 Bit** executeable, then its called

**The Installation launcher.**

It **needs a support file** called **\_inst32i.ex\_** to install under a **win32 OS.**

This Installation is a bit different from the one i have cracked in this Tutorial.

**\_inst32i.ex\_ is compressed but not with icomp, but it dont matter !!!**

and it contains the following files :

**INSTALL.EXE**  
**\_INS0432.\_MP**  
**LZWSERV.EXE**  
**\_INZ0432.\_MP**  
**WUTL95i.DLL**  
**\_WUTL95.DLL**  
**BOOT16.EXE**  
**\_INJ0432.\_MP**

You can retrieve these File-Names at the beginning of  
\_inst32i.ex\_ by yourself.

Setup will do the initialization and then it **uncompresses**  
\_inst32i.ex\_ into your

**Windows-Temp (C:\Windows\Temp).**

When ya start the Installation you will see the following in  
Windows\Temp:

<b>&lt;_ISTMP0.DIR&gt;</b>	<b>DIR</b>	<b>This dir will be</b>
<b>created by _ins0432._mp !!!</b>		
<b>_INS0432._MP</b>	<b>659 KB</b>	<b>This is exactly</b>
<b>Setup.exe from this Tutorial !!!</b>		
<b>_INZ0432._MP</b>	<b>20,1 KB</b>	<b>This is LZWSERV.EXE</b>
<b>(doing the de-compress.)</b>		
<b>_WUTIL95.DLL</b>	<b>36,0 KB</b>	<b>A win95 support file</b>

**\_ISTMP0.DIR content :**

<b>_SETUP.LIB</b>	<b>151 KB</b>	<b>This is exactly</b>
<b>the same compressed lib file !!!</b>		
<b>1f8584.DLL</b>	<b>89,0 KB</b>	<b>Support DLL</b>
<b>INSHELP.DLL</b>	<b>23,5 KB</b>	<b>Yup, da same DLL !!!</b>
<b>UNINST.EXE</b>	<b>292 KB</b>	<b>Also da same</b>

**one**

You see now that there are the same files, but only  
**renamed** , thats all !!!

Copy and rename them if you wanna work with these files.

## **G) WIN32.HLP**

**These Dissciptions comes from win32.hlp**

---

### **GetDriveType:**

The GetDriveType function determines whether a disk drive is a removable, fixed, CD-ROM, RAM disk, or network drive.

#### **UINT GetDriveType(**

**LPCTSTR IpRootPathName // address of root path**  
**);**

#### **Parameters**

##### **IpRootPathName**

Points to a null-terminated string that specifies the root directory of the disk to return information about. If IpRootPathName is NULL, the function uses the root of the current directory.

#### **Return Value**

The return value specifies the type of drive. It can be one of the following values:

##### Value Meaning

- |   |  |
|---|--|
| 0 | The drive type cannot be determined.       |
| 1 | The root directory does not exist.         |
| 2 | The drive can be removed from the drive.   |
| 3 | The disk cannot be removed from the drive. |
| 4 | The drive is a remote (network) drive.     |
| 5 | The drive is a CD-ROM drive.               |
| 6 | The drive is a RAM disk.                   |

---

### **GetVolumeInformation:**

The GetVolumeInformation function returns information about a file system and volume whose root directory is specified.

#### **BOOL GetVolumeInformation(**

```

        LPCTSTR IpRootPathName, // address of root
directory of the file system
        LPTSTR IpVolumeNameBuffer, // address of
name of the volume
        DWORD nVolumeNameSize, // length of
IpVolumeNameBuffer
        LPDWORD IpVolumeSerialNumber, // address
of volume serial number
        LPDWORD IpMaximumComponentLength, //
address of system's maximum filename
length
        LPDWORD IpFileSystemFlags, // address of
file system flags
        LPTSTR IpFileSystemNameBuffer, // address of
name of file system
        DWORD nFileSystemNameSize // length of
IpFileSystemNameBuffer
    );

```

#### Parameters

##### **IpRootPathName**

Points to a string that contains the root directory of the volume to be described. If this parameter is NULL, the root of the current directory is used.

##### **IpVolumeNameBuffer**

Points to a buffer that receives the name of the specified volume.

##### **nVolumeNameSize**

Specifies the length, in characters, of the volume name buffer. This parameter is ignored if the volume name buffer is not supplied.

##### **IpVolumeSerialNumber**

Points to a variable that receives the volume serial number. This parameter can be NULL if the serial number is not required.

##### **IpMaximumComponentLength**

Points to a doubleword value that receives the maximum

length, in characters, of a filename component supported by the specified file system. A filename component is that portion of a filename between backslashes.

The value stored in variable pointed to by \*lpMaximumComponentLength is used to indicate that long names are supported by the specified file system. For example, for a FAT file system supporting long names, the function stores the value 255, rather than the previous 8.3 indicator. Long names can also be supported on systems that use the NTFS and HPFS file systems.

### **lpFileSystemFlags**

Points to a doubleword that receives flags associated with the specified file system. This parameter can be any combination of the following flags, with one exception: FS\_FILE\_COMPRESSION and FS\_VOL\_IS\_COMPRESSED are mutually exclusive.

Value	Meaning
FS_CASE_IS_PRESERVED	If this flag is set, the file system preserves the case of filenames when it places a name on disk.
FS_CASE_SENSITIVE	If this flag is set, the file system supports case-sensitive filenames.
FS_UNICODE_STORED_ON_DISK	If this flag is set, the file system supports Unicode in filenames as they appear on disk.
FS_PERSISTENT_ACLS	If this flag is set, the file system preserves and enforces ACLs. For example, NTFS preserves and enforces ACLs, HPFS and FAT do not.
FS_FILE_COMPRESSION	The file system supports file-based compression.
FS_VOL_IS_COMPRESSED	The specified volume is a compressed volume; for example, a DoubleSpace volume.

### **lpFileSystemNameBuffer**

Points to a buffer that receives the name of the file system (such as FAT, HPFS, or NTFS).

### **nFileSystemNameSize**

Specifies the length, in characters, of the file system name buffer. This parameter is ignored if the file system name buffer is not supplied.

## Return Value

If all the requested information is retrieved, the return value is TRUE; otherwise, it is FALSE. To get extended error information, call GetLastError.

## Remarks

The FS\_VOL\_IS\_COMPRESSED flag is the only indicator of volume-based compression. The file system name is not altered to indicate compression. This flag comes back set on a DoubleSpace volume, for example. With volume-based compression, an entire volume is either compressed or not compressed.

The FS\_FILE\_COMPRESSION flag indicates whether a file system supports file-based compression. With file-based compression, individual files can be compressed or not compressed.

The FS\_FILE\_COMPRESSION and FS\_VOL\_IS\_COMPRESSED flags are mutually exclusive; both bits cannot come back set.

The maximum component length value, stored in the DWORD variable pointed to by

lpMaximumComponentLength, is the only indicator that a volume supports longer-than-normal FAT (or other file system) file names. The file system name is not altered to indicate support for long file names.

The GetCompressedFileSize function obtains the compressed size of a file. The GetFileAttributes function can determine whether an individual file is compressed.

---

## **GetWindowText:**

The GetWindowText function copies the text of the specified window's title bar (if it has one) into a buffer. If the specified window is a control, the text of the control is copied.

### **int GetWindowText(**

**with text**                    **HWND hWnd,            // handle of window or control**  
**LPTSTR lpString,    // address of buffer for text**  
**int nMaxCount        // maximum number of**  
**characters to copy**

);  
Parameters

### **hWnd**

Identifies the window or control containing the text.

### **lpString**

Points to the buffer that will receive the text.

### **nMaxCount**

Specifies the maximum number of characters to copy to the buffer. If the text exceeds this limit, it is truncated.

### **Return Value**

If the function succeeds, the **return value is the length**, in characters, of the copied string, not including the terminating null character. If the window has no title bar or text, if the title bar is empty, or if the window or control handle is invalid, the return value is zero. To get extended error information, call GetLastError.

This function cannot retrieve the text of an edit control in another application.

### **Remarks**

This function causes a WM\_GETTEXT message to be sent to the specified window or control.

This function cannot retrieve the text of an edit control in another application.

## **H) LAST WORDS**

Yeah, you made it =)

This is the end of this tutorial and i hope i could teach you something , more or less.

If you have any **questions, suggestions** or just wanna gimme some **feedback**, then just email me !!!

Also plz inform me if you have find out any error - iam only

a human being =)

This Tutorial was first written under note-pad, but it got just to big, so that i had to continue writting it with WordPad. I hope you dont mind it ;) The next Tutorial (natz-2) will be in html and i dont exactly know what it will discuss yet, so just watch out for it !!!
