

## CELLULAR DIGITAL PACKET DATA RUN-THROUGH

End users reside at MESs (Mobile End Systems), using a computer, phone, or other device to communicate with cell sites, which contain MDBSs (Mobile Data Base Stations). MDBSs act as data relays between the MES and MDISs (Mobile Data Intermediate systems). Routers (or gateways) complete the connection between the MDIS and the FES (Fixed End System). The FES is geographically fixed, as in a corporate WAN or LAN.
