PREFACE

This document is a compilation of frequently asked questions and their answers about Visual Basic for Windows and Visual Basic for Applications which have been gathered from posts to the comp.lang.basic.visual newsgroup. Although efforts have been made to find obvious errors, there is no guarantee that the information in this document is error-free. Neither the FAQ maintainer nor anyone else associated with this document assume ANY liability for the content or use of this document. If you find any errors, please report them to the address given below.

This FAQ document is protected by international copyright regulations. Permission is granted to distribute it freely, both in electronic and written format, provided no charge is made. Also, do not make changes to this document without the consent of the maintainer. Usenet netiquette applies.

Most FAQs (including this one) are available at the anonymous ftp archive site "rtfm.mit.edu". All parts of the VB FAQ may be found in the directory "pub/usenet/comp.lang.basic.visual".

You can also have the VB FAQs e-mailed to you by sending a message to "mail-server@rtfm.mit.edu" with ONLY the text **SEND USENET/NEWS.ANSWERS/VISUAL-BASIC-FAQ/*** in the BODY of the message.

As the FAQ maintainer, I don't have time to explore all of the aspects of Visual Basic. I rely on your submissions to improve the quality and inclusiveness of this document. If you have found a VB hint, tip, trick, work-around, etc., please write it up and send it to me!

Jan Steinar Haugland (Jan.Haugland@uib.no), VB/Win FAQ maintainer

Please note that my first language is not English. You can safely ignore all typos, but if you find an error that is so embarrassing you can't help pulling your hair and screaming loud, just send me a note and I'll correct it quietly. OK?

I would like to thank all contributors, and also all those who have given constructive feedback. This FAQ is now widely distributed in the net community.

Special thanks to the following people who have made many and invaluable contributions to the VB/Win FAQ: Kris Nosack (the previous maintainer), Peter Millard, Nic Gibson, Mr. "D" (the anonymous contributor), George Tatge (gat@csn.org), Andy Dingley (dingbat@codesmth.demon.co.uk), and those I may have forgotten (sorry).

Tim Roberts is responsible for the Windows Help File version of the FAQ. If you have any problems with the Help file he can be contacted directly at TJR@AC.DAL.CA.

Your help is GREATLY appreciated!

Does VB/Win make standalone .EXE files?

VB/Win produces .exe files, but they are not standalone. All VB/Win programs must be distributed with the VBRUNx00.DLL file (where x is the major version number). This DLL must accompany all VB/Win programs, but only one such file should reside on every system where VB programs are used.

What is the current version of Visual Basic for Windows?

VB/Win is currently at version 3.0

Where can I get updated VB and other Microsoft files?

Microsoft Software Library (MSL) is accessible from the following services:

- Compu\$erve

GO MSL

Search for <filename.EXE>

- Microsoft Download Service (MSDL)

Dial (206) 936-6735 to connect to MSDL

- Internet (anonymous FTP)

ftp ftp.microsoft.com

Change to the \softlib\mslfiles directory

(There are a LOT of files in this directory! It is not advisable to list all the files unless you have good time.)

Help! I am lost on ftp.microsoft.com.

You no longer have to be! The site have been reorganised, and you'll find the file DIRMAP.TXT in root (or whatever it's called on a 3.5 NT server). Here's the file as I found it (stolen ruthlessly from the server for your convenience):

This file is to help you find your way around ftp.microsoft.com. This file only covers the directory structure two levels deep. If you see a 'kb' directory in a second level directory, it contains all of the information regarding that second level directory. For example, the /developr/win32dk directory has a kb directory in it. This kb directory contains all of the articles for any 32 bit development kit.

Root Directory	Sub Directory	Contents
ADVSYS		Advanced Systems, Networks, Mail
	LANMAN	LanMan & other networks
	MAIL	Mail and Schedule+
	MSCLIENT	Microsoft Networking Client
	SQL_ODBC	SQL and ODBC

Thanks to Richard Mason (richard@whitney.demon.co.uk) for the map he made for us before this long overdue reorganisation, and thanks for bringing this to my attention.

Where can I get good up-to-date information about VB?

If you do any VB programming at all, you really should get the latest copy of the Microsoft Knowledge Base from one of the sources listed above! The filename is VBKB.EXE or VBKB_FT.EXE for the version with full text searching. The Knowledge Base is a Windows help formatted document that is updated almost monthly. (Beware: The files are huge!)

The EXE files on ftp.microsoft.com (and other places) are simple self-extracting files. They don't do any automatic updating of your system, just dump the file(s) inside them in the current directory on your disk, uncompressed and ready for use. Just replace the old files on your system with the new files (same name, usually).

This FAQ (ahem) is a pretty good source as a digest of many of the VB issues that are discussed in the comp.lang.basic.visual newsgroup, but as such the information contained in this FAQ may not have been thoroughly tested or verified.

For easier access to and use of this FAQ document, get the Windows Help file format FAQ doc by anonymous ftp to quasar.sba.dal.ca and look under /www/hlp. The .HLP version is made by Tim Roberts (TJR@SBACOOP.SBA.DAL.CA). This is HIGHLY RECOMMENDED.

Dave McCarter puts out a nice Windows help formatted document called "Visual Basic Tips and Tricks". A good resource with information that isn't found in the Knowledge Base. It can be found by anonymous ftp to ftp.cica.indiana.edu /pub/pc/win3/programr/vbasic/ as VBTIPS??.ZIP, where '??' is the version number (yes, get the one with the highest number).

There is presently an effort to put together a VB code library so that VB users can share their best - and trickiest - programming work. The code library project is being spear headed by Hein Ragas who has managed to get a directory on CICA for code snippets to be deposited. Stayed tuned to comp.lang.basic.visual for more information.

There's a VISBAS-L mailing list for Visual Basic. You can subscribe to this mailing list by sending an email to

LISTSERV@tamvm1.tamu.edu

Place the following text in the *body* of the message (no, not the subject line):

SUB VISBAS-L Real Name

Where Real Name is just that, *your full real name* not your email address. Note that the traffic on this list may overflow your mailbox if you have a limited mail buffer. Expect around 40-50 messages every weekday, a bit less during weekends. Also, to unsubscribe, do as above but with "UNSUB" in the body of the message to the LISTSERV address, *not* to the VISBAS-L list address itself (Believe it or not, we usually receive 2-3 sub/unsub mails every day on the list, and we're really fed up!) Also, this mail server was split and a new list called VBDATA-L was made for Vb database (Jet) related topics. Same procedure for registering (SUB VBDATA-L Real Name).

Sorry, I know no mailservers or other Internet resources dedicated to VBA specifically. Send me any information you may have, and I'll bring it on.

There are several Usenet newsgroups dedicated to MS Windows programming and use. There's recently been a major group creation process. Those groups that may be of special interest to VB programmers are marked with *:

comp.os.ms-windows.misc comp.os.ms-windows.programmer.misc comp.binaries.ms-windows comp.os.ms-windows.advocacy comp.os.ms-windows.announce
comp.os.ms-windows.apps
comp.os.ms-windows.nt.misc
comp.os.ms-windows.nt.setup
comp.os.ms-windows.programmer.tools*
comp.os.ms-windows.programmer.win32
comp.os.ms-windows.setup*
comp.os.ms-windows.programmer.winhelp*
comp.os.ms-windows.programmer.networks
comp.os.ms-windows.programmer.graphics
comp.os.ms-windows.programmer.controls*

The latest groups have been added to split the enormous traffic on the *.misc groups down in managable chunks. However, the second group (.programmer.misc) contains lots of interesting info (mostly C related), if you have the time to read it all!

Also note comp.lang.pascal which is a very good newsgroup for Pascal, including Borland Pascal and Turbo Pascal for Windows.

Please don't use this guide to find out where you should crosspost VB questions. Check the charter for each group before posting to it. If you are sure that your crosspost is legitimate, please note the crossposting in the text.

NOTE: PLEASE don't post VB stuff to comp.lang.visual. This group has *nothing* to do with Visual Basic, and the academics discussing "real" visual programming there are very, very annoyed at what they call "quasi-visual" stuff and postings about those languages to their group.

If you have a Compu\$erve account, you will find a forum for Visual Basic there, including some support from Microsoft:

MS BASIC Forum (GO MSBASIC)

17 3rd Party Products 17 3rd Party Products

There are magazines dedicated to VB. The best known is Fawcett Technical Publications' _Visual Basic Programmer's Journal_ (VSPJ). Phone 800-848-5523 (for US credit card orders) or 303-541-0610 (int'l and US other orders), Email 74003.224@compuserve.com to Shirley Modric for subscription info. Address is 280 Second Street, Suite 200, Los Altos, CA 94022-3603 USA.

From Randy Coates (rcoates@telerama.lm.com):

I currently subscribe to "Inside Visual BASIC for Windows" from the Cobb Group. Although it is a helpful monthly paper (about 14 pages per publication), I find it to be overpriced when compared to VB Programmers Journal. Here is the information anyway: Domestic \$59/yr (\$7.00 each); Outside US \$79/yr (\$8.50 each)

Phone: Toll Free: 800-223-8720), Local: 502-491-1900, Customer Relations Fax: 502-491-8050, Editorial Department Fax: 502-491-4200. Address: _Inside Visual BASIC for Windows_, 9420 Bunsen Parkway, Suite 300, Louisville, KY 40220.

(Note: for completeness other VB magazines should be listed, and I would like to receive info on those!)

Are there any examples of commercial applications built using Visual Basic?

Profit by Microsoft was written mostly in Visual Basic. In fact, Profit was one of three programs selected as PC Magazine's Editor's Choice among Windows small business accounting packages.

Microsoft uses VB extensively for smaller utilities. 3 of the small apps in Windows and Windows for Workgroups Resource Toolkits are written in VB. Also, if you have the Microsoft Bookshelf CD-ROM, you will notice that the MVOPTION.EXE program, which is an "options" program for MS Viewer, is created in VB.

Note: The existence of VBX files in a package doesn't necessarily mean that it was written in VB. The most popular C++ compilers also support VBXes.

What's the difference between MODAL and MODELESS forms?

MODAL forms are forms which require user input before any other actions can be taken place. In other words, a modal form has exclusive focus until it is dismissed. When showing a modal form, the program pauses at the SHOW command until the modal form is either hidden or unloaded. The internal MsgBox and InputBox forms are examples of modal forms. To show a form modally, use the syntax:

MyForm.SHOW 1

MODELESS forms are those which are shown but do not require immediate user input. MDI child forms are always modeless. To show a form modeless, use the syntax:

MyForm.SHOW

When/Why should I use Option Explicit?

Option Explicit forces you to declare all variables before using them. Opinions vary greatly on this subject. The main reason to use the OPTION EXPLICIT statement at the top of all modules is to minimize the amount of bugs introduced into your code by misspelling a variable name. Most variants of BASIC (including VB) have the capability to create variables 'on the fly' (without any declarations). This capability can be a double edged sword.

At the minimum, some suggest using the DEFINT A-Z statement in leu of OPTION EXPLICIT. This statement will cause any variables which are created on the fly to be created as integers as opposed to variant (VB 3.0) or single precision (VB 1.0 and 2.0). (Integers take up less memory).

The OPTION EXPLICIT statement causes VB to 'disable' its ability to create variables on the fly. Thus, all variables must be declared using a DIM or REDIM statement. All variables not declared will cause an error when the OPTION EXPLICIT statement is used. This will eliminate bugs caused by a misspelled variable. The option works module-wide, so you can have some modules with and some without this option in your project.

Why does everybody say I should save in TEXT not BINARY?

Actually, saving in binary mode is a bit faster, so why do we recommend you to save in text?

If you save the source and the project as text, it becomes ASCII (or really, ANSI) code that you can edit with any text editor or (if you are careful when you save) word processor. If you save in binary, only the VB development environment, current or later versions, will understand the code. The Setup Wizard can not scan binary projects. Also, source documenters and other programming tools usually require text mode. If you use text, you can use a simple text editor (ie. notepad) to cut and paste code from other source/form modules into your current project. Some 'tricks' (like making an array of 1 control into a single non-array control again) is easily done with an editor but not that easy in the environment. If you want to print your project to paper the file|print option in the VB environment is often not good enough; you may want to import the text files into your word processor. And, finally, if something goes wrong (only one byte is changed!) you may be out of luck in binary mode. In text mode you will more easily be able to fix it.

Is the Variant type slower than using other variable types?

Generally, yes, if we are talking numeric variable types. The Variant type also increases memory overhead. To test the speed difference, try the following piece of code in something like a button_click event and keep the debug window on the screen:

```
Dim Va As Variant
Dim In As Integer
T1! = Timer
For i% = 1 To 32766
    Va = i%
Next i%
T2! = Timer
Debug.Print "With variant: "; Format$((T2! - T1!), "0.0000")
T1! = Timer
For i% = 1 To 32766
    In = i%
Next i%
T2! = Timer
Debug.Print "With integer: "; Format$((T2! - T1!), "0.0000")
```

This test shows (on our test system) that integers are ~60% faster! However, for strings there where no real difference, or in some instances, variants were faster than strings for routines with heavy conversion usage. For the best result in your application, test your routines directly.

How do I make a text box not beep but do something else when I hit the Enter key?

Put "something else" in your _KeyPress event, depending on what you really want. This code example makes *nothing* happen, for an extended period of time:

```
Sub Text1_KeyPress (KeyAscii As Integer)
    If KeyAscii = 13 Then '13 is Key_Return
        KeyAscii = 0
    End If
End Sub
```

This might not be a very nice thing to do, since your users usually have some intention when they press Enter. Often they will want to jump to the next control, like the Tab key does. To have the Enter key emulate the Tab key action, you will need to add the line 'SendKeys "{tab}" above 'KeyAscii=0' in the example above (Yes, I thought KeyAscii=9 works but it doesn't! Tab is obviously handled by Windows on a lower level).

By the way, you'll also find this in the Microsoft VB Knowledge Base (see KB Q78305 and Q85562).

Note: If MultiLine=True you will *not* want to disable the normal behaviour of the Enter key.

How do I get the Tab key to be treated like a normal character?

You must set TabStop = False for ALL controls on the active form. Then you will be able to insert "tab" (chr 9) characters in controls like the text box.

If you feel you need the Tab key to behave "normal" (ie. jump to next control) outside this specific control, it is trivial to emulate its functionality in code:

```
Sub Command1_KeyDown (KeyCode As Integer, Shift As Integer)
  If KeyCode = 9 Then
    If Shift = 0 Then
        Command2.SetFocus 'Tab=Next control
    ElseIf Shift = 1 Then
        Command3.SetFocus 'Shift-Tab=Prev.ctrl.
    End If
  End If
End Sub
```

...etc.

How do I implement an incremental search in list/dir/combo/file boxes?

This is your lucky day. Dan Champagne (Dan_Champagne@dell.com) made some VB code (no DLLs are necessary!) which easily provides this feature for your applications:

```
'Code by Dan Champagne, '4/18/94
'This code can be used to do an incremental search in either a
'list box, dir, combo, or a file box. The following code is set
'for a file box called FILE1. To make it work with a list box, or
'a file box with a different name, change all occurences of FILE1
'with whatever you or VB has named your list, combo, dir, or file box.
'There are two places where you will need to change these. They are
'on the last couple of lines in the KeyPress code.
'Also, thanks to John Tarr for helping debug the code.
'In a .BAS file, add the following:
'searchme$ is a global variable that will keep track of what the
'user has typed so far.
Global searchme$
'The following needs to be on one line.
Declare Function SendMessageBystring& Lib "User" ALIAS "Send Message" (ByVal
hWnd%, ByVal wMsg%, ByVal wParam%, ByVal lParam$)
Global Const WM USER = &H400
Global Const LB SELECTSTRING = (WM USER + 13)
Global Const LB FINDSTRING = (WM USER + 16)
'In File1 under keydown, add the following:
'This checks if the user has pressed the up or down arrow.
'If they have, reset searchme$ to "".
If KeyCode = 40 Or KeyCode = 38 Then
      searchme$ = ""
End If
'In File1 under lostfocus, pathchange, patternchange, and click add:
'If the user has done any of the above, reset the searchme$
'string.
searchme$ = ""
'In File1 under keypress add:
Dim result&
```

```
Select Case KeyAscii
      Case 8 Backspace
            If searchme$ <> "" Then
                 searchme$ = Left$(searchme$, Len(searchme$) - 1)
            Else
                 File1.ListIndex = 0
            End If
            KeyAscii = 0
            Exit Sub
      Case 27 Escape
            searchme$ = ""
            KeyAscii = 0
           Exit Sub
      Case 13 Enter
           searchme$ = ""
            KeyAscii = 0
            Exit Sub
      Case Asc("a") To Asc("z"), Asc("A") To Asc("Z"), Asc("'"), Asc("."),
Asc(" "), Asc("0") To Asc("9")
            searchme$ = searchme$ & Chr$(KeyAscii)
            KeyAscii = 0
End Select
result& = SendMessageBystring(FILE.hWnd, LB FINDSTRING, 0, searchme$)
If result& = -1 Then
     searchme$ = Left$(searchme$, Len(searchme$) - 1)
Else
     result& = SendMessageBystring(FILE1.hWnd, LB SELECTSTRING,-1, searchme$)
End If
```

How do I make an animated icon for my program?

For an example on how you change the icon for your application as it is displayed when it is minimized, see the example REDTOP in the \samples\picclip directory for VB/Win 3 Pro. This demonstrates a fancy animated icon.

What is passing by reference?

Arguments are either passed by reference or by value. When they are passed by value, they cannot be changed by the procedure or function they are passed to. They *can* be altered when passed by reference, since passing by reference is just passing the address.

Note that procedures are less strict about variable types when you use BYVAL. If you declare that your Sub takes a Variant, VB takes that seriously and gives a nasty "mismatch error" if you try to pass ie. a string to it. Make it ByVal (at the cost of some speed) and your sub will be more tolerant.

Also note the following nasty trap: Arguments are passed by reference unless enclosed by parentheses or declared using the ByVal keyword. [VBWin Language Ref., p. 55]

I get a "file not found" error on the IIF function when I distribute by program. Uh?

There's a documentation error, since the manual does not tell you that the IIF function requires the file MSAFINX.DLL to be distributed with your application. No, IIF is not financial (I should know, I study finance right now, or at least I should be doing that ;-]).

Is there any way to pass a variable to a form apart from using global variables?

The standard workaround is to put an invisible text box (or caption or any other control that suits your use.) on the target form and access it by Form.textbox = "value". Then you can use the Change event of that control to do anything you want in that form. Also, check out the .Tag property which is a "what-youwant" property where you can hook any string you want onto a control. This property can also be accessed from other modules.

[Dave Mitton (mitton@dave.enet.dec.com)]

How should dates be implemented so they work with other language and country formats?

If you use ie. MM/DD/YY format dates in a program, you will get either a runtime-error (ie. month>12) or the wrong date (ie. March 12 instead of December 3) when your program is used in Europe. And vice versa, of course. Even Microsoft's own example programs (like the MAPI sample) make this stupid mistake and fail miserably. Use the Format command to make sure you get the date you want. For example:

```
strTodaysDate = Format[$](Now, "Short Date")
```

As a side note, Microsoft has taken much heat on the newsgroup for VB's bad support for internationalization! Just try to make a date literal in source code that works everywhere as a little exercise. Answer elsewhere in this document. No prizes :-)

Can a VB application be an OLE server?

No. You'll have to use an external DLL/VBX. If you see any examples, please tell the newsgroup.

How do I dial a phone number without using the MSCOMM VBX?

The MSCOMM VBX that comes with VB/Pro is great for creating communication programs, but it's overkill for dialing a phone number. Try the following code:

```
PhoneNumber$ = "(123)456-7890"
Open "COM2" For Output As #1 'or COM1
Print #1, "ATDT" & PhoneNumber$ & Chr$(13)
Close #1
```

lan Storrs <exuian@exu.ericsson.se> informed me that he had experienced problems with this when the VB program was run from a network drive. A file named "COM1" was created on the disk! This trick is probably not a good idea for bigger applications, but it's nice for small personal utilities.

I have [several] megabytes of memory. Why do I get an "out of memory" error?

Unfortunately, Microsoft has been more famous for memory barriers than anything else. This is a late descendant of the infamous 640K barrier that has been plaguing us for years. Although Windows allows the user to access several megabytes of memory, it uses two limited (64K) memory areas called User Heap and GDI Heap for some specific data structures. Go to the Help|About box in Program Manager to see the percentage of free resources in the *most* exhausted heap. If these areas are exhausted, you are out of luck. VB programs are unfortunately rather greedy on these structures. Windows 4 is supposed to free us from this limitation...

Note that every visible control (i.e. every button) is a window to Windows. Every new control takes up some bytes in the precious User heap.

Also, there is another way to run out of memory in Windows, not related to VB. Windows requires free Upper Memory Area (UMA, also called Upper Memory Blocks, not to be confused with High RAM, which is the first 64K of extended memory) to do certain tasks. If you use QEMM or DOS 6+ MemMaker and you have many device drivers (network, etc.) this area may have been filled up before you launch Windows. You will then be unable to start applications, even though you have plenty of free RAM. The problem can be solved with careful memory setup, but this is far beyond the scope of this FAQ.

On a completely unrelated problem: When you run a program with an outline control with some ATI graphics cards, it may crash with just that error message. (see Knowledge Base Q100194 PRB: "Some ATI Video Drivers Hang When Using MSOUTLIN.VBX")

How do I mimic a toggle button?

The only "fix" we know for this problem is to use a picture or image control to mimic the action of a button or button3d control. You need two bitmaps, one for buttonup and one for buttondown (and perhaps one more for inactive state). This is a kluge, we know. Look at the button bar used in the MDINOTE sample program supplied with VB for an example of this.

How do I get my application on top?

To force a form to the front of the screen, do the following command:

```
Form1.ZOrder
```

To make the application *stay* on top, put the Zorder command in a Timer event repeatedly called, say, every 1000 msecs. This makes a "softer" on-top than other methods, and allows the user to make a short peek below the form.

There are two different "Zorder"s of forms in Windows, both implemented internally as linked lists. One is for "normal" windows, the other for real "topmost" windows (like the Clock application which is distributed with MS Windows). The Zorder command above simply moves your window to the top of the "normal" window stack. To make your window truly topmost, use the SetWindowPos API call like this:

```
'Make these declares:

Declare Function SetWindowPos Lib "user" (ByVal h%, ByVal hb%, ByVal x%,
ByVal y%, ByVal cx%, ByVal cy%, ByVal f%) As Integer

Global Const SWP_NOMOVE = 2

Global Const SWP_NOSIZE = 1

Global Const FLAGS = SWP_NOMOVE Or SWP_NOSIZE

Global Const HWND_TOPMOST = -1

Global Const HWND_NOTOPMOST = -2

'To set Form1 as a TopMost form, do the following:
res% = SetWindowPos (Form1.hWnd, HWND_TOPMOST, 0, 0, 0, 0, FLAGS)
'if res%=0, there is an error

'To turn off topmost (make the form act normal again):
res% = SetWindowPos (Form1.hWnd, HWND NOTOPMOST, 0, 0, 0, 0, FLAGS)
```

Is there a way to break long lines in VB code?

There is unfortunately no line continuation character in VB/Win 3.0. Excel 5 VBA does, however, use Space+Underscore (" _") as a line continuation character, and we hope this will be included in the next version of VB.

There are a few tricks you can use to reduce line length, but unfortunately there is very little to do with DECLARE statements which can get very long.

Print your source in landscape :-

How do I remove/change the picture property of a control at design time?

Mark the (bitmap) or (icon) text in the property window and press Del or Backspace. "No!" I hear you cry, "It doesn't work". Well, it does if you first select the object from the combo box at the top of the Properties Window, and then immediately afterwards doubleclick (or paint over) the "(bitmap)" text and press Del. Alternatively, just click on another control, then click back to the first control. Now Del works. Who said "bug"?

If you want to paste your picture directly into the VB program by pressing Ctrl-V when you are editing the picture property, you will have to use a similar procedure: select the control, select the property, press Ctrl-V. If you try it again without deselecting the control first (or selecting it from the combo box), it doesn't work.

Is a [foo] VBX/DLL available as shareware/freeware?

Part 4 of the FAQ is Adam Harris' excellent "Shareware Custom Controls List". Please consult this list before you post this question.

The following type of controls are NOT known to be available as sw/pd/fw for Visual Basic, only as commercial toolboxes (If you feel like making any of these for VB and sharing it for a modest fee, you will become very popular!):

- a. ZModem communication control/source
- b. Rich Text Format-control or other mixed font/word processor control (rumours indicate that this will be in the Windows 4 API, and therefor available from VB)
- c. Matrix math

If any of these should be available, please tell us.

How do I make my applications screen-resolution independent?

There are two methods: Either get a custom control that does the job for you, or you write lots of complicated code in the Load and Resize events.

For the first option, check out VideoSoft's \$hareware VSVBX.VBX (download VSVBX.ZIP from Cica or mirrors). It has a will of its own, as you will experience, but it's generally better than trying what is described below.

For the brave (or stupid), try to write "screen resolution-smart code" in the form's Load event. If the form is resizable (normally it should be), you'll have to put some magic into the Resize event as well. There are 4 rules of thumb:

- a. Do not trust the form's height and width properties. These measure the entire form, not the client area where your controls are. To see this in action, create a simple applet with the only code being in the resize event which resets a line control from 0,0 to the form's width,height properties. The top left corner is in the client area, the bottom right corner disappears. The API call GetClientRect will return the size of the client area in pixels. You can use the screen object's TwipsPerPixelX and TwipsPerPixelY properties to convert from pixels to twips. If that's not enough, GetWindowRect will return the actual size of the entire form, client and non-client areas combined. GetSystemMetrics will return individual pieces of things like border width/hight, caption height, etc.
- b. Use the TextWidth and TextHeight properties. You can use them off the form if all your controls share the same font, otherwise use them off of the given control. I typically do a TextWidth("X") and TextHeight("X") to get a value which I use as a margin between controls. I grab these values on startup, and multiply it by 2, 1.5, .75, .5, .25 to get varying margin sizes, depending on how close or far apart I want to space things. If your control has an autosize property, you may want to use it, and then calculate the maximum width of a control in a given "column" of controls on your screen and position all of them accordingly.
- c. Try not to resize your controls in the resize event. You will spawn another resize event in the process. Of course, you can use a flag to determine whether the resize event is the original event or the spawned one. Using the load event, and setting the forms borders to fixed minimizes the amount of work you have to do.
- d. Make sure you use a consistent scale. I don't even bother with the scale properties, but instead just convert pixels (from API calls) into twips and be done with it. If you do use scale properties, be sure you convert your numbers correctly. I had no end of difficulty when I failed to convert into twips with one number that was used in a series of calculations to position controls. Also be sure all your controls share the same SCALE -- another nasty problem I had before I gave up on them completely. [Thanks to our generous anonymous source "D"]

How do I do Peek and Poke?

VB provides no mechanism for this. There are several 3rd party pkgs. which provide this. Also, this often comes up in regards to the comm ports and you can many times do what you want with the mscomm.vbx.

[George Tatge (gat@csn.org)]

See also the Shareware Custom Controls List FAQ file

Why doesn't "my string" & Chr\$(13) do what I want?

You need to also add a Chr\$(10): "my string" & Chr\$(13) & Chr\$(10) will give you a CR and LF. [George Tatge (gat@csn.org)]

How do I prevent multiple instances of my program?

In VB 3, the property App.PrevInstance is set to True if an older instance of the program already exist.

The following piece of code, stolen from MS KB article Q102480, will activate the old instance and then terminate itself:

As Robert Knienid@(rknienid@(email.tuwien.ac.at) informed me, this piece of code WILL NOT work for non-English versions of MS Windows where the word for "Restore" does not have "R" as the underlined word. Replace the "R" in the SendKeys line above with "{ENTER}" or "~".

Note that you shouldnt prevent multiple instances of your application unless you have a good reason to do so, since this is a very useful feature in MS Windows. Windows will only load the code and dynamic link code *once*, so it (normally) uses much less memory for the later instances than the first.

How do I implement an accelerator key for a text box?

You want to use a label caption to identify a text box and to act as if it were the text box caption:

Example:

&Label1 [text1]

How should I do to set the focus to text1, by typing <ALT>L

Make sure that the TabIndex property for the text box is 1 greater than the label's TabIndex. Since a label can't have the focus, the focus will go to the next item in the tab order, which would be the text box.

Here's any easy way to set the TabIndex for a busy form. Select the object that should be last in the tab order and then select the TabIndex property. Press 0 (zero), click on the next to last object, press 0, click on the next object back, press 0, etc. When you're done, all of the TabIndexes will be in order, because VB increments all of the higher TabIndexes when you put in a lower number.

Many thanks to Jonathan Kinnick and Gary Weinfurther that provided the answer on the FIDO net echo VISUAL_BASIC.

[Tiago Leal (Tiago.Leal@p25.f1.n283.z2.gds.nl)]

How do I tell when an application executed using the SHELL command is finished?

Shell() doesn't really return a task handle, it returns an instance handle. Any documentation that says otherwise is wrong. But never mind that; the answer to your question is to use the API call GetModuleUsage.

```
'Put this in the general declarations of your form/module
Declare Function GetModuleUsage Lib "Kernel" (ByVal hModule As
Integer) As Integer

'Here's where you shell out to the other program
intHandle = Shell("PROGRAM.EXE")
Do While GetModuleUsage(intHandle) > 0
DoEvents
Loop
```

[Kenn Nesbitt, Microsoft Consulting Services (kennn@netcom.com)]

How do I access C style strings?

Use the 'Istrlen' and 'Istrcpy' calls found in the Kernel DLL.

How can I change the printer Windows uses in code without using the print common dialog?

You can change the printer the VB 3.0 Printer object is pointing to programmatically (without using the common dialogs). Just use the WriteProfileString API call and rewrite the [WINDOWS], DEVICE entry in the WIN.INI file! VB will instantly use the new printer, when the next Printer.Print command is issued. If you get the old printer string before you rewrite it (GetProfileString API call), you can set it back after using a specific printer. This technique is especially useful, when you want to use a FAX printer driver: Select the FAX driver, send your fax by printing to it and switch back to the normal default printer.

[Hajo Schmidt (hajo@bwl.bwl.th-darmstadt.de)]

It is recommended (and polite, as we're multitasking) to send a WM_WININCHANGE (&H1A) to all windows to tell them of the change. Also, under some circumstances the printer object won't notice that you have changed the default printer unless you do this.

```
Declare Function SendMessage(ByVal hWnd As Integer, ByVal wMsg As Integer, ByVal wParam As Integer, lParam As Any) As Long Global Const WM_WININICHANGE = &H1A Global Const HWND_BROADCAST = &HFFFF 'Dummy means send to all top windows.
```

lRes = SendMessage(HWND BROADCAST, WM WININICHANGE, 0, ByVal

[Nic Gibson (nic@skin.demon.co.uk)]

"Windows")

Any tips for speeding up VB?

Who said "code in C"????; -)

- a. When SHOWing a form with lots of bound controls, have a blank frame covering everything.
 Then, in the Form_Activate event, set the Frame. Visible = False. This greatly speeds the display of the form and hides ugly thrashing as the data controls initialize.
 [Christopher Biow (biow@cs.umd.edu)]
- b. Try to keep any Global definitions to a minimum. Massive numbers of global variables really seem to slow VB Windows down (besides chewing up memory). In other words, if you've pasted a lot of stuff from the globals.txt file, trim all definitions and variables you don't use in your application.
- c. Keep the total number of controls and forms used to a minimum (you've probably already guessed that).
- d. Keep fancy graphics to a minimum (another one you know).
- e. Try "pre-processing" in the background (using Do_Events). Doesn't really speed anything up, but often there is a lot of "idle" time while the user is selecting menu's, buttons and such if you can do some calculations, image loading or whatever during this idle time your user perceives the application is faster than it really is.
- f. Hide often-used forms rather than unloading them. Unloading saves memory, but it takes longer to re-load a form than to simply "un-hide" it.
 [Tips b to f by Galen Raben (galenr@gr.hp.com)]

The following tip is along the same lines, but with a code sample. They are provided by Andy Dingley (dingbat@codesmth.demon.co.uk):

You're limited by the system as to how quickly you can go from calling frmMyForm. Show to being able to type into the controls, but you can make the form *appear* to display faster. One technique is to keep forms loaded, and just switch their visibility on and off. This is heavy on resource usage, and doesn't help for the first time they're shown.

Most forms have some processing (eg. querying a table to fill a list box) that goes on when they're first opened, and this is what causes the most serious delay. It's possible to display the form, make its controls appear on screen, then do the slow processing before finally making the form "live". As the user can see things happening, the perceived delay is less obvious.

Include the following code in your form:

Sub Form_Load
 FirstActivation = True
End Sub

Show the form by using: Screen.MousePointer = HOURGLASS frmMyForm.Show MODAL

Bruce Garrett (bruceg@access2.digex.net) had the following tips from his VBITS 93 notes:

- Polling a control for its properties directly is 10 to 20 times slower then placing the property values you need into variables and testing the value of the variables.
- Swap tuning: Modules are not loaded until used; put related code in the same modules, reduce the number of intermodule calls and keep modules small.
- Binary file I/O is faster then Text/Random.

There was also a lot of discussion about "apparent" speed i.e: how it looks on the screen as opposed to how fast it's chugging internally. It was noted that the cute little flashing menu items and exploding windows in the Mac amounted to a little razzle-dazzle to distract you from how long it took to actually load something and get it on the screen. Keeping all your forms loaded but hidden until needed was suggested. Also the use of progress indicators and a simple quickly loaded and drawn startup form. Also preloading data you expect to need.

How do I speed up control property access?

Instead of using a property in a loop, you will be better off using a normal variable in the loop and then assign the variable once to the property afterwards. Also, when reading a property, you should read it once into a variable instead of using it in a loop.

Sometimes it is not possible to simply put contents of a property into a variable. For example, if you are using a list box or you need to conserve memory. In these cases you can send the WM_SetRedraw message to the control to prevent redrawing. You can typically increase the speed 6-10 times - or even more.

```
'Add the following declares:
Declare Function SendMessage Lib "User" (ByVal hWnd As Integer,
ByVal wMsg As Integer, ByVal wParam As Integer, lParam As Any) As
Long
Const WM_SetRedraw = &HB

'Add this to your code:
Result% = SendMessage(Text1.hWnd, WM_SetRedraw, 0, 0)
'redraw off
'Do your stuff here!
Result% = SendMessage(Text1.hWnd, WM_SetRedraw, 1, 0)
'redraw on
```

This same method applies to list boxes and other controls.

How much gain in performance will I get if I write my number crunching routines in instead of Visual Basic?

Probably the best solution to the number crunching problem is to write the number crunching routines as a custom control or a DLL, and plug it into a VB app. VB interface handling is not significantly slower than, say C++, and most of the wait is associated with Windows.

Some real world experience speaks volumes about this one:

I wrote some time consuming code in VB to solve a combinatorical (does this word exist in English?) problem. The code consists of one main recursive function, which calls itself very often. It took a night to compute a certain problem. I was rather disappointed and then decided to write the central routine in C++. It was a 1:1 transcription. The routine was compiled with the MS C++-Compiler. It took only 22 Minutes for the same problem. Amazing, isn't it? The routine doesn't do any floating point arithmetic, only integer, and handles some arrays. The PC was a 33MHz 486. And the second amazing thing is, that a IBM RS6000 (560)-Risc-machine needed 17 Min for the same code. I was the only one on the machine. I thought it should be much faster. The MS C++ seems to make very fast, optimized code. The optimization was configured to make fast code.

[Christoph Steinbeck (steinbeck@uni-bonn.de)]

How do you make a TEXTBOX read only? Or, how do I prevent the user from changing the text in a TEXTBOX?

There's a lot of ideas on this one. You can grab the _KeyPress and _KeyDown events and set them to zero. However, the best idea is to use the Windows API SendMessage function to tell the control to become read-only:

```
'After making the following declarations...

Global Const WM_USER = &H400

Global Const EM_SETREADONLY = (WM_USER + 31)

Declare Function SendMessage Lib "User" (ByVal hWnd As Integer

ByVal wMsg As Integer, ByVal wParam As Integer, lParam As Any) As

Long

'Then Try:

SendMessage(Text1.hWnd, EM_SETREADONLY, 1, 0)

[Pete Jones (pjones@csi.compuserve.com)]
```

This will still allow the user to copy *from* the text box. If you need to disable this (why?), steal the Ctrl-C in the _KeyPress event.

How can I create a VBX?

VBXs (Visual Basic eXtensions) are practically always written is C (Borland C++, but mainly MS VC++). You should refer to the _Control Development Guide_ (in VB Professional Features Vol. I) and any relevant documentation for your compiler. Followup questions should normally be directed to comp.os.ms-windows.programmer.* or comp.lang.c*.

There are some example VBX's with C code supplied with VB3 Pro. You'll find them under the directory [VB] \CDK .

How do you change the system menu (on the Control-Menu Box)?

You can turn off the minimize and maximize menu options by changing properties, but what if you need to remove the "close" option?

```
'Make the following declares.

Declare Function GetSystemMenu Lib "User" (ByVal hWnd As Integer, ByVal bRevert As Integer) As Integer

Declare Function RemoveMenu Lib "User" (ByVal hMenu As Integer, ByVal nPosition As Integer, ByVal wFlags As Integer) As Integer

Global Const MF_BYPOSITION=&H400

'Use the following code to remove the "close" option.

SystemMenu% = GetSystemMenu (hWnd, 0)

Res% = RemoveMenu(SystemMenu%, 6, MF_BYPOSITION)
'(also remove the separator line)

Res% = RemoveMenu(SystemMenu%, 6, MF BYPOSITION)
```

Adding menu items to the control menu is more complicated, since you need to respond to the events triggered when the user selects the new options. The newest Message Blaster (msgblast.vbx, see details in beginning of FAQ about how to get files) contains example code.

How do I play MID, WAV or other multimedia files?

Use the MSMCI.VBX, provided with VB/Win Pro 3.0. You can also declare and call the MM-functions manually:

```
Declare Function mciExecute Lib "MMSystem" (ByVal FileName as
String) As Integer

Sub Form1_Click ()
    iResult = mciExecute("Play c:\windows\mkmyday.wav")
End Sub
```

How can I call a 'hidden' DOS program from VB?

If you run a DOS program minimized using the SHELL command, it will never complete. This is because DOS tasks by default are NOT setup to run in the background. The easiest way to get around this is to make a PIF file for the program you need to run with the "Background" option checked. Then SHELL to the PIF file to run the DOS program and it will return control to your VB application when it terminates.

Tip: If you edit or replace the _DEFAULT.PIF file in the Windows directory to allow execution in background, this will apply to all DOS boxes that is not run with it's own .pif!

How do I do drag & drop between applications?

Get the file FMDROP10.ZIP from ftp.cica.indiana.edu in the vbasic directory. It is a good VB example of drag & drop. You may also want to get the MSGBLAST VBX (3-64.ZIP at ftp.microsoft.com in the MSDN directory) since you will need to have access to Windows messages in order to do drag & drop - unless you get a VBX to do it for you.

Also, the D&DSERVE example from Windows Tech Journal Aug 92 includes a DLL for this purpose. This is available from some ftp sites.

Short glossary for the confused ones :-)

Drag & Drop Client: the form you drop objects to/on

Drag & Drop Server: the form you drag object(s) from

How do I use GetPrivateProfileString to read from INI files?

There's a good example of accessing *.INI files in the Knowledge Base, but here's the basic idea:

```
'You declare these API function as usual:

Declare Function GetPrivateProfileString Lib "Kernel" (ByVal
lpApplicationName As String, ByVal lpKeyName As Any, ByVal
lpDefault As String, ByVal lpReturnedString As String, ByVal
nSize As Integer, ByVal lpFileName As String) As Integer

'Then in your code you do like below:
strIniFile = "WIN.INI"
strSection = "MyProgram"
strKey = "Language"
strDefault = "English"
iLength = 70
strReturn = String$(iLength, " ") 'Pad the string first!
iResult = GetPrivateProfileString(strSection, strKey, strDefault,
strReturn, iLength, strIniFile)
```

WARNING: Be aware that there was an ERROR in the Windows 3.1 API documentation that came with VB. Here's the scoop:

Knowledge Base article Q110826 (DOCERR: GetPrivateProfileString Declaration Incorrect in API) corrects a documentation error for the GetPrivateProfileString function call as described in the Windows version 3.1 API Reference help file that shipped with Microsoft Visual Basic version 3.0 for Windows. The CORRECT declaration is as follows:

Declare Function GetPrivateProfileString Lib "Kernel" (ByVal lpApplicationName As String, ByVal lpKeyName As Any, ByVal lpDefault As String, ByVal lpReturnedString As String, ByVal nSize As Integer, ByVal lpFileName As String) As Integer

Note that the "ByVal" keyword was omitted from the second parameter in the online reference. This means that the function is passing the second parameter (lpKeyName) by reference. It needs to be passed by value.

The most common problem that occurs when using the incorrect declaration is that when the function is called, it returns a copy of "lpdefault" in the "lpReturnedString" parameter instead of the actual value referenced by KeyName.

.

How do I implement Undo?

For most controls, you will have to keep track of changes yourself. There's no magic involved, just some coding. However, if you use the standard Text box or Combo box, Windows provides a "free" undo function for you!

```
'Do the following declares:
Declare Function SendMessage Lib "User" (ByVal hWnd As Integer,
ByVal wMsg As Integer, ByVal wParam As Integer, lParam As Any) As
Long
Global Const WM_USER = &h400
Global Const EM_UNDO = WM_USER + 23

'And in your Undo Sub do the following:
UndoResult = SendMessage(myControl.hWnd, EM_UNDO, 0, 0)
'UndoResult = -1 indicates an error.
```

How do I create a window with a small title bar as in a floating toolbar?

Download the MSGBLAST VBX from ftp.microsoft.com (filename "8- 3.ZIP") or (better) from ftp.cica.indiana.edu. The example files provide an example of a form with a small title. When you see it, you'll understand why I haven't include a full explanation here!

What is Pseudocode?

VB/Win does not generate machine code like most compilers do. Instead it creates what is called pseudocode (a real misnomer, IMO). A good explanation is given below:

A bit of history: the original P-code was an instruction set for a "virtual Pascal" machine. This came with a portable Pascal compiler written at ETH in Zuerich. The portable compiler produced instructions for this phony machine which had an instruction set ideally suited to the stack and heap management of Pascal. To executed portable Pascal programs, you had two choices: either write an interpreter for P-code, or translate the small set of P-code instructions (there were about 80) into assembler; assemble it; and run it at native speed. Thus "P- code" originally stood for "Portable" or "Pascal" code.

The broader meaning, "pseudo-code" came later. P-code was widely popularized by the UCSD Pascal system, a small workstation that was implemented entirely in Pcode and interpreted. It was sold for some years, and one company even re-did the microcode for a PDP-11 microchip to interpret P-code. The original Borland Turbo Pascal had obvious similarities to the UCSD system although it was not interpreted. The dialect was virtually identical.

Today P-code is used extensively in Microsoft apps, for two reasons. First, it is much more compact than native code; so the apps are smaller. Second, having an interpreter at the core of an app makes it much easier to customize and extend. That is why VB is becoming the heart of the MS major apps. It is simply not true that P-code apps run much slower than native apps. The slowdown is determined by the granularity of the interpreted routines. If every little thing is an interpreted op, the slowdown might be as much as 3-to-1 for the 80x86 architecture, or about 2-to-1 for the Motorola 68000 family (which is better suited to writing interpreters).

But in practice, modern P-code systems have large-scale instructions, each of which is executed by a big compiled subroutine. These subs run at native speed, so the overhead of the interpreter is occasional at worst. [Roger E. Ison (r ison@csn.org)]

It is also possible that since the code may not need recompilation to run on other platforms *if* the runtime interpreter is first ported, VB applications can become very portable. This depends on Microsoft's long-term plans.

A note on the word "pseudocode": I wrote above that it is a misnomer, and I stand on that. Pseudocode is *really* the pascal-like (mostly) explanation of an algorithm that is intended for human readers, not computers. But since somehow the term pseudocode stuck to the psaudo-machine-code created by VB the word is used here.

Does VB support pointers to functions?

No, it does not. [George Tatge (gat@csn.org)]

How do I program the Novell NetWare API from VB?

Tom Tregilgas (Tom.Tregilgas@InfoB.unisg.ch) had a lot of information on this one. Normally I leave it to the other FAQ parts to list books & how-to-get-info's, but since this topic is very specific and more NetWare than VB I include all the stuff here for your convenience:

If you are interested in seeing how Visual Basic can be used for NetWare programming, obtain the following files from your friendly neighboorhood Novell FTP Mirror site.

Mirror sites are (according to ftp.novell.com):

Novell Germany: ftp.novell.de Netherlands: ftp.rug.nl

United Kingdom: ftp.salford.ac.uk Logan, Utah: netlab2.usu.edu New Zealand: tui.lincoln.ac.nz Tuscaloosa: Alabama, risc.ua.edu Ottowa, Ontario, CA: novell.nrc.ca Boston, Mass: bnug.proteon.com

novlib\11\nivb.zip, Netware Interface for Visual Basic novlib\11\nwtest.zip, NetWare Test for Visual Basic

There are also two Novell App Notes on the subject of using NetWare with Visual Basic (although this is _NOT_ supported by Novell...) which are:

October 92, Interfacing Visual Basic for Windows and NetWare July 93, A NetWare Interface for Visual Basic

The AppNotes can be obtained by contacting the Novell Research Order Desk, FAX: +1 303 294-0903, Voice 800 377-4136, +1 303 297-2725. Address as follows:

Novell Research Order Desk 1601 Park Avenue West Denver, CO 80216-5199

AppNotes are \$95/year (\$135 outside US)

Here are a few books which might help you out to figure the calls out:

Windows Development on NetWare Systems, Lori Gauthier and Sue Whitehead (c) 1994, Windcrest, Blue Ridge Summit, PA 17294-0850 (McGraw-Hill) \$34.95 Comes with disk This book also tells you how to "upgrade" to the currently supported SDK calls

NetWare System Interface Technical Overview, Novell (c) 1990,1989 (Addison-Wesley), \$32.95 (describes Novell's C Network Compiler API's)

Visual Basic Programmer's Guide to the Windows API, Daniel Appleman Ziff-Davis Press, 5903 Christie Ave, Emeryville, CA 94608, \$34.95 Comes with disk

It should be mentioned that the APIs included with the NIVB are _not_ current, and for this purpose, you should get the Novell SDK kit. Also, Novell will not support NIVB, but you can sometimes get some helpfrom Compu\$erve, or from others on the Infobahn <g>

Good luck!

p.s. It behooves you to become a member in the PDP (Professional Developer's Program) since

- you get the AppNotes (& Bullets!) for...free.
- p.p.s. Novell does NOT support the NIVB...
- p.p.p.s. Also, no docs come with it. You'll probably need the Client C SDK kit to be able to really _use_ the code.
- p.p.p.p.s. To make things even better, the calls in NIVB are fairly old, and not of the Client C SDK kit variety. However, there _are_ books which could help you out, e.g. "NetWare System Interface Technical Overview", by Novell. ISBN:0-201-57027-0, published by Addison-Wesley Publishing co, \$32.95 US, \$42.95 in Canada.

Some Visual Basic 4 rumours

First, we have no special information. This is just rumours, guessing, gossip! But since there are many questions about this on the newsgroup, *and* Microsoft gives these controlled leakages through their beta testers, we bring on some of it (Please, don't start discussing NDA's on this group again!):

- a. Two versions: 32-bit and 16-bit Like Visual C++ 1.5, VB 4 will come with compilers for the 16-bit API from Windows 3.1 as well as a real 32-bit compiler (or pseudocompiler) for Windows 4 (Chicago) bundled together.
- b. New features will probably be inherited from VBA
 - i) Line continuation character " _ " (space+underscore)
 - ii) WITH statement, known from Pascal, to save typing and make code cleaner. An example:

```
With Form1
    With Text1
    Bold = true
    FontName = "New Times Roman"
    End With
End With
```

- iii) FOR EACH .. NEXT statement allows you to make changes to a group of objects at once better than FOR..NEXT. Object groups are also something you may have to work closer with in VB4.
- iv) An OPTIONAL statement allows you to leave some Variant parameters undefined when calling a user-defined sub or function. Also in VBA is an ARRAY function that returns an array form a list supplied as parameters, and a special optional ParamArray optional parameter of Variants.
- v) Boolean data type. Integer does the job, but this type can preserve space if Microsoft codes it right.
- vi) Byte data type? No, VBA does not support this. We can dream, however.
- c. VBX is dead. Long live OCX!

You may not feel for celebrating this either, but the 32 bit VB 4 will not support the old 16-bit VBX'es. The 16-bit version of VB 4 will support them for backwards compatibility, but be aware that OLE 2 and OCX is the way of the future, at least if Microsoft gets it as they want.

What is the Windows API?

The Windows API (Application Program Interface) is a collection of Dynamic-Link Libraries (DLLs) that do most of the common things in Windows. Calls to the Windows API gives you access to routines that do things like drawing menu bars, manipulating bitmaps, playing sound files, and pretty much every other function of Windows.

How do I call a DLL?

Basically, you declare a DLL procedure which you can call in your VB program which in turn passes data to and/or retrieves data from the DLL. You should read the section of the VB manual that talks about calling DLLs ("Chapter 24 Calling Procedures in DLLs" in the VB 3.0 Programmer's Guide). This chapter covers the basics of using the Windows API DLLs and calling DLLs in general. Beyond that you may want to find a good book on this subject since it is too large to cover here (see the Book Listing in the Appendix of the General FAQ - Part 1). Don't be too intimidated! Using DLLs (especially many of the Windows API functions) is quite easy, once you learn how to call them. In fact, many of the newer DLLs include VB-compatible modules!

What about DLL calls that require callbacks?

VB does not support callbacks, but various extensions can help.

Dan Appleman's "Visual Basic Programmer's Guide to the Windows API" comes with a floppy disk which code samples and tools. It also includes a VBX which supports the callbacks which many API calls require. Dan is also founder and president of Desaware which sells more extensive tools, including SpyWorks, for VB developers.

[Walter Hill (whill@netcom.com)]

Tips for calling DLLs (such as the Windows API)

- a. Using the BYVAL keyword is critical. Using it when you're supposed to call by reference and (more common) not using it when you are to give a value to the external function are the single most common mistakes. Wrong calling convention can often result in a General Protection Fault (GPF) or, even worse, corruption of another applications' data.
- b. Check return and parameter types. For return types, a C function declared as "void" means you use a Sub not a Function.
- c. Initialize strings by padding it to the necessary length! If you pass a string that is too short to the API it will happily write past the end of the string and possibly corrupt data.
- d. Use Option Explicit. A typing error that results in a bug in the VB source will occasionally cause a GPF when you call external code.
- e. It's a jungle out there! Check parameter values as there is no type checking outside VB. If you make a mistake, you'll often get a GPF.
- f. Save before you run! You may even need to restart Windows after a GPF, since DLL's often aren't unloaded properly. As a second option you can check out WPS (Windows Process Status) which is distributed with VB/Pro and placed in the CDK directory. This utility allows you to kick out any module (EXE, DLL) from memory (shooting yourself in the foot if you want to. WPS is a nice way to find out what DLLs are actually used, but save your work first!).

Why can't I use an index with my VB accessed database?

There is a mistake in the docs which says you can set the active index for a recordset. You can't. The data control uses the primary key for tables and physical order (I think) for dynasets.

[Nic Gibson (nic@skin.demon.co.uk)]

Why does my compiled VB database app generate an error when it ran just fine in the design environment?

You can thank Microsoft for documenting this topic so poorly. When you compile your VB database application, you must also have an INI file for it which provides the correct pointers to the appropriate database drivers. Therefore, if your application is named "INVOICE.EXE", you will need to have a properly configured "INVOICE.INI" file in your Windows directory. The file, EXTERNAL.TXT, that came with VB should explain all about it.

Is the Access Engine and Visual Basic Pro good enough for database work?

That, of course, depends. Generally the answer is "yes", but you may need some third-party add-on products.

These are the major weaknesses of VBPro's database functions:

- a. Limited data controls: No add, delete or search button; no bound list box or masked edit control and the worst no bound grid!
- b. No run-time query builder ("how good is your user in SQL?") or report builder.
- c. No direct advanced control of the Access 1.1 (or 2) Database Engine (ie. security, optimization, etc.).

The good news is that lots of companies are willing to sell you products which address one or more of the above weaknesses.

Also, if you build a database application with advanced database relations, it can be a good idea to build the database itself with Access and the front-end with VB.

How do you avoid the "Invalid use of null" error when reading null values from a database?

If you try to retrieve a null value (empty field) from a database, you will get the error: "Invalid use of Null". Here is one way to get around this problem:

I've worked around this problem with the following code:

```
TextBox.Text = MyTest.Fields("TestFld") & ""
```

This code converts the Null-Value into an empty string.

[Ralf Metzing (rmm@dragon.stgt.sub.org)]

What is "NULL"?

Contrary to popular belief, Null is not nothing. It's even less than nothing. 8^)

The VB documentation describes all the horrors of misunderfstanding the infamous NULL. Since people don't read the documentation, we feel like informing that

If ThisVarIsNull = NULL then DoSomething

will *always* fail, and the DoSomething can't possibly be executed. You *must* use IsNull(ThisVarIsNull) which will return True if the var is Null (phew!).

If you want to find out why someone came to think of this strange value, read some relational database theory.

How can I access a record by record number?

Use a counter or index field and access the record with this.

It is *impossible* to ask a relational database system to give you ie. "field number 3 in record number 10" since by definition a relational database does not have row or column numbers. Databases allowing direct access like that is not even remotely relational.

Access (and therefore, VB) is about as close to a real relational database system as you can get.

Tips for VB database programming:

- a. Use Access and QBE. Once it's "working" (even if the parameters are hardcoded), then open up View.SQL and copy the stuff from the SQL window into your VB code. If you need to insert VB variables, try testing this under Access by using parameters instead. They're then nice & easy to spot when it comes to converting into VB I always call my parameters "PR_xxxx", so I can just search my VB code for this to find any instances that I've missed.
- b. It never works first time. So put an error handler into your VB code that copies the contents of SQLStr onto the clipboard, should the query fail. Now it's quick & easy to switch back to Access, find a scratch query and paste the erroneous SQL into that. It's *much* easier to debug a SQL query in Access, after the variables have been merged in, than it is to do it blind from VB.
- c. Use carriage returns to break up your SQL. One before each reserved word is sensible. They're not significant in SQL. I assume you're not stupid enough to put them in the middle of field names unfortunately Debug.Print is!
- d. When merging in the contents of a variable (building a SQL query in a VB string), it should *always* be surrounded by an ampersand and 3 double quotes, or an ampersand and 2 mixed quotes, depending on your local conventions:

```
SQLStr = SQLStr & "WHERE Username <= """ & Username$ """ "
or
SQLStr = SQLStr & "WHERE Username <= "" & Username$ "" "
```

e. If you're using dates, then it will *always* be one quote, a hash and an ampersand:

```
SQLStr = SQLStr & "WHERE Start Date <= #" & Format$(CutOffDate, "Long Date") & "#"
```

- f. Another tip with dates is to format them with the long date format, not the short date. This is then safe against the transatlantic reversal of month & day position.
- g. If you're merging in a field/table name, enclose it in square brackets. That way the SQL will still be valid if the variable contains spaces:

```
SQLStr = "SELECT * FROM [" & TableName$ "];"
```

When building SQL strings in VB, then you'll often do this on several lines, concatenating SQLStr with the new string. If you leave a space at the end of every string, then you can guarantee you won't have problems with the text from successive lines running into each other.

h. If you're using Access 1, you'll keep running into the 1024 character limit on the length of a SQL string. Keep the table & field names short, especially if many JOINs are concerned. Using underscores in names is shorter than spaces, as you don't need the extra 2 characters for the square

brackets around them. If your SQL is slightly too long, then you'll probably see a "Missing semicolon" error, even though the semicolon is obviously there (To you, anyway!).

- I. Making a QueryDef is a complicated process that is often slower than executing the query! Don't mess with the .SQL property, as that is equally slow (Access needs to do a lot of work to turn SQL into its internal query format). Two ways around this: Use ready-built queries, written with Access. If you need to merge in values from variables, then use a query with parameters. Setting parameter values is quick to execute.
- j. If you really need to build SQL on the fly -- you need to build an ad hoc query, or to supply table or field names (which can't be done with query parameters), then try using:

database.Execute SQLStr

As this doesn't build a QueryDef, then it's quick.

[All tips a to j by Andy Dingley(dingbat@codesmth.demon.co.uk)]

How come I get a "No Current Record" error when I use a Data Control on an empty table?

Well, this is a "feature" courtesy of Microsoft. KB article Q106494 explains this in detail. Basically, the workaround is to add an empty record to the table before the user can do anything (or before you try to do any Moves on the Table).

[George Tatge (gat@csn.org)]

How can I speed up my VB database application?

KB article Q109830 gives some hints. Things you should do include:

- Use Snapshots when possible.
- Use transactions whenever possible.
- Use Dynasets when possible.
- Use SQL action queries when possible.

[George Tatge (gat@csn.org)]

How about Access 2.0 compatibility?

You need the compatibility layer availability. The file COMLYR.EXE is in the MSBASIC library on Compuserve. This file provides all the items necessary for compatibility between VB 3.0 and Access 2.0. [Fred Griffin (72321.3230@compuserve.com)]

The file COMLYR.EXE can be downloaded from ftp.microsoft.com. It is located in the directory /softlib/mslfiles.

How do I get a bitmap picture in a field in an Access database?

See p.466 of the Visual Basic (3.0) Programmer's Guide. It contains a section called "Using Bound Picture Box and Image Controls". Basically you have to bind the VB PictureBox to a field in the Access DB, set the .Picture property in the PictureBox, and then move to the next record or something. VB will then store your picture in Access in a form in which it can be retrieved by VB in the future.

If you store the pictures in Access directly (using Access), VB won't be able to read them (using VB 3.0 and Access 1.1).

You can also store the picture's filename as a text field in the database and use LoadPicture() to load that file into the VB PictureBox. [Tim Shea (shea@marcam.com)]

What are some tips for using Setup Wizard?

There were loads of bugs in the setup utilities supplied with VB3. Be sure to get the newest version of SETUPKIT (usually called SETUPK.EXE or -.ZIP). It is available from the sources listed in the beginning of this document, and in the General FAQ.

Alternatively, if you have the older versions, you may have to manually remove the line referring to OLE2UI.DLL in the file SETUPWIZ.INI. See later in this document for dates of newest files on ftp.microsoft.com. Follow the instructions in SETUPK.TXT exactly. The files actually belong in two separate directories. Not placing them correctly can create strange and unusual side effects -- none of them good(!)

Set all involved EXE, DLL and VBX files to Read-Only so that the setup program doesn't modify them. [Charles F. Mulks (21667cfm@msu.edu)]

A *very* good tip. Actually, make all executables on your system read-only. If not, you can get a sharing violation if you try to run the same DOS executable twice at the same time.

Also, the source code for a SETUP program is *included* with VB3 Pro. It is quite trivial to tailor it to your specific needs.

The question remains: Is SetupWiz good? No! Good enough? Perhaps.

Are there restrictions on what I can distribute with my VB program?

The documentation tells what parts of the Visual Basic kit you can freely distribute: the VBX files, some DLL's and what the SetupKit includes on your distribution diskettes. Reading software license agreements may be more boring than asking the newsgroup, but is nevertheless a good idea. 8^)

There have been some rumours on the newsgroup that you can't redistribute programs written with VB freely. This is nonsense. All applications created with VB can be redistributed freely without royalties (as long as you don't distribute proprietary external files).

The rumours probably originated when Microsoft announced that they will not sell kits allowing third-party software to include the Visual Basic for Applications (VBA) system.

What alternatives to setup wizard do I have?

Perhaps the best one is to simply modify the setup app which is supplied with VB. Look in your VB directory for the setupkit\setup1 directory. There you will find everything you need to do a complete setup program. This sample setup is coded to install a few sample app files and create a program group. You can comment out those lines and change to your files and program mgr. group. There are also a few global variables you will want to change. All of this is contained in the comments in the code.

Using this, and the distribution information in the manual telling you about which files to distribute with your app will make things much easier than using the setup wizard (IMNSHO).

There are also several third party setup products available.

Do I need to worry about users who have Progman replacements such as Norton Desktop and PC Tools?

Earlier versions of those products and some others do not respond properly to the DLL commands to create groups and items. More recent versions do. All you can do in this case is to include some information in your readme.txt file that instructs users of those products to shut them down and start up program manager before installing.

Can I distribute my app without vbrunXXX.dll?

If you are sure that your users have it or can get it, you can easily distribute your app without vbrunXXX.dll. Simply remove the file from your distribution disk or zip file and ALSO remove it from the setup.lst file.

Why won't my setup program install commdlg.dll et. al.?

There are a couple of DLLs that are almost always in use by windows. Commdlg.dll is the most common example. When faced with this problem, there is no easy way out. The full explanation is several pages long and beyond the scope of this FAQ. The general idea is as follows:

Your setup program will need to create a .BAT file to expand and then copy these files. Then, it will need to shutdown Windows (see ExitWindowsExec API call) and run the .BAT file. Then it will need to restart windows and continue your setup program. Your setup program should delete the temporary .BAT file that is no longer needed.

Where do I install VBXs and DLLs?

PLEASE- this is one place where everybody's life is much easier if you will follow Microsoft's recommendations. All PUBLIC VBXs and DLLs should be installed in the windows/system directory! A "PUBLIC" DLL or VBX is any which can be purchased on the open market. In other words, if another VB programmer might possibly use the same VBX or DLL, install it in the system directory.

If you have written private VBXs or DLLs that will never be used by any program but yours, you can install them in the same directory where you install your application files.

There are lots of good reasons for doing this, but it makes a short novel to rehearse them all.

Multiple identifiers after the DIM statement can be confusing

Some with background from Pascal can try the following

```
Dim iA, iB, iC as Integer
```

and think that all these 3 variables end up as Integer. In fact, the first two end up as default data type, normally Variant.

Instead you should do

```
Dim iA as Integer
Dim iB as Integer
Dim iC as Integer
```

which takes up more space, but gives you room to comment your variables (hint, hint); *or*

```
Dim iA%, iB%, iC%
```

which does the whole job.

"Clean up" your project before final EXE compilation.

When you are ready to compile your VB project into your 'finished' EXE, be sure to save the project files, exit VB, restart Windows, run VB, load your project and go straight to compiling. Otherwise, your EXE may be larger in file size than necessary due to 'garbage' getting included in the EXE. For some reason, VB does not fully clean up all of the previously used variables or objects that you may have been playing with while developing your program so these get included in your EXE even though they aren't used. Other VB users have even advocated saving all the project files as ASCII, then loading the ASCII files before compiling to further "clean up" the resulting EXE file.

Multiple END statements can be dangerous; or, The program that refused to terminate.

Suggestion: put the END statement used to exit your program *only* in the Form_Unload event of the main form. Whenever you want to end the program, just tell the main form to unload.

Some have reported that after their program have (supposedly) terminated, it still appears in the task list. This can happen if you only hide secondary forms and forget to unload them when you end/unload the main form.

Also note that the Stop-button on the button-bar of the integrated development environment doesn't really unload anything. It *nukes* the program, which generally is a good idea since it could be a bug in it that caused it to be stuck in an eternal loop or something.

What are the latest versions of the various files used by VB?

File to download	Updates files	<u>Description</u>
BTR110.EXE	BTRV110.DLL	Btrieve IISAM Driver
DATAINDX.EXE	DATAINDX.DOC	"Data Access Guide" Index
GENERIC.EXE	\VB\CDK\GENERIC	Sample custom control source
VBGRID.EXE	GRID.VBX	Grid control
VBHC505.EXE	HC.EXE, HCP.EXE	WinHelp compiler
MSAJT.EXE	MSAJT110.DLL	Access Database Engine
MSCOMM.EXE	MSCOMM.VBX	Serial Communications\control
ORA110.EXE	ORACLE.TXT	Updated ORACLE.TXT file
SETUPK.EXE	SETUP.EXE	Setup Toolkit
VBRUN300.EXE	VBRUN300.DLL	Visual Basic Runtime Library
XBS110.EXE	XBS110.DLL	XBase IISAM Driver
	BTR110.EXE DATAINDX.EXE GENERIC.EXE VBGRID.EXE VBHC505.EXE MSAJT.EXE MSCOMM.EXE ORA110.EXE SETUPK.EXE VBRUN300.EXE	BTR110.EXE BTRV110.DLL DATAINDX.EXE DATAINDX.DOC GENERIC.EXE \VB\CDK\GENERIC VBGRID.EXE GRID.VBX VBHC505.EXE HC.EXE, HCP.EXE MSAJT.EXE MSAJT110.DLL MSCOMM.EXE MSCOMM.VBX ORA110.EXE ORACLE.TXT SETUPK.EXE SETUP.EXE VBRUN300.EXE VBRUN300.DLL

There is an article in the Microsoft Knowledge Base that points to each of these files and provides more detailed information about the update. To find these articles, query the Microsoft Knowledge Base using the file name and the word "update3.00". Note the NEW SETUPKIT update! [Thanks to Marks Harrop harrop@werple.apana.org.au]

Please inform the FAQ maintainer about newer versions.

Any tips for VB/Win 3 programmers moving to VBA?

You are in for some surprises. VBA is more unlike VB than most people thought. Especially the development environment is very different, and the language puts more emphasis on objects. The latter is a trend you can get used to for VB also.

For Excel 5 VBA, be aware that the environment is based on the "workbook" idea Microsoft stole from Borland. Your controls will be placed in one sheet, and the code will be in another. Double-clicking on the control to open the code window doesn't help. You have to use the "Tools|Assign Macro" menu option.

Also, be aware that the list of events is nowhere close to what VB3 supports! No GotFocus, no MouseMove, no nothing. You'll be very confused if you try to look for "events" in the VBA docs!

Does VBA support VBXs?

No. If Microsoft have its way, VBX is a dead end. There will never be 32-bit VBXs, but OCXs using OLE 2. VBA is more a subset of VB 4 than VB 3, but it does not fully support OCX yet. It will, though.

How do I access properties on my dialog boxes in VBA?

As noted above, VBA is a cultural chock for VB programmers. If you create a textbox in VBA, call it txName and try to

```
cMyVar=txName.Text
```

the impolite interpreter will give you a "variable not defined" error.

The magic is objects. You have to

```
Dim txName as Object
Set txName = DialogSheets("NameDialog".EditBoxes("txName"))
```

And then you can access your properties like you used to in good of VB 3. (Anyone volunteer to beat senseless the guy who thought out this?)

How do I use database routines from Excel VBA?

The documentation is somewhere between sparse and nonexistent on this topic. Any info on VBA and SQL would be much appreciated.

Here Microsoft breaks the tradition and you *can't* use database objects, at least not the way you do in VB. Also, forget dynasets.

I know nothing about databases in VBA. I just bring on the following tips from various magazines:

Both SQLOpen and QueryGetData require a 'connection string'. That's about what the doc's say about the parameter. What is it? The doc is also tragically void of useful examples. Someone dug up the following example:

```
"DSN=My data file; DBQ=c:\access\data.mdb; FIL=RedISAM;"
```

which is about as understandable as it looks. If you use an empty string, you get a dialog which also can give you the string into a spreadsheet cell.

Also, search for SQLREQUEST in the *main* help file for Excel 5 (not the VBA help!) for these examples of connection string's:

dBASE DSN=NWind; PWD=test

SQL Server DSN=MyServer; UID=dbayer; PWE=123; Database=Pubs

ORACLE DNS=My Oracle Data Source; DBQ=MYSER VER; UID=JohnS; PWD=Sesame

There's a KnowledgeBase on Excel 5 on ftp.microsoft.com. Last time I looked, it was void of database stuff. Still, it may be a good idea to download it as the situation may have changed now.

ZipInf

Alarm

Control: alarm1.vbx Archive: alarm11.zip Author: Mabry Software Price: \$10.00

Version: 1.1

Keywords: schedule

Triggers events, like the timer, but using specific times rather than intervals. Wildcard matching elegantly allows you to trigger events at regular intervals (i.e., every 10 minutes).

BarCode

Control: barcod1.vbx Archive: barcod11.zip Author: Mabry Software Price: \$15.00

Version: 1.1 Keywords: data

Generates bar codes, in 4 different styles. Can be bound to a data field.

BmpLst

Control: bmplst1.vbx Archive: bmplst16.zip Author: Mabry Software Price: \$20.00

Version: 1.6

Keywords: list, graphic

List box with pictures, vertically aligned over a caption.

Calendar

Control: calendar.vbx Archive: vbcal.zip

Author: Rijnhaave Office Automation Price: \$0.00

Version:

Keywords: calendar

Wierd and buggy date entry box with pop-up calendar. No customization, no documentation.

CTLWhWnd

Control: ctlwhwnd.dll Archive: vbhwnd.zip Author: Jonathan Zuck Price: \$0.00

Version: Keywords: api

One function, ControlhWnd, which returns the hWnd for a given control.

EndTask

Control: entask.dll Archive: entask.zip Author: Jeff Simms Price: \$0.00

Version:

Keywords: task

Intercepts "End Task" from the Task Manager.

File and Disk Space Info

Control: dfinfo1.vbx Archive: dfinfo14.zip Author: Mabry Software Price: \$15.00

Version: 1.4

Keywords: disk, file

Two controls provide technical statistics of a drive and extended file information, respectively.

File Manager Drag and Drop

Control: fmdrop1.vbx Archive: fmdrop10.zip Author: Mabry Software Price: \$15.00

Version: 1.0

Keywords: file, drag-drop

Enables drag and drop of single or multiple files from the File Manager or what have you.

Four Controls

Control: <see below> Archive: vb4ctrls.zip Author: Jeng Long Jiang Price: \$0.00

Version:

Keywords: graphic, status

Four graphic controls: vmeter.vbx and hmeter.vbx are "flooding" status gauge controls; spin.vbx (!) is a spin tool. The best of the lot seems to be 3dlabel.vbx, which is actually a button which holds states like a toolbar button. No documentation.

FXTools Demo

Control: fximage.vbx Archive: fxtool.zip
Author: ImageFX
Price:

Version: 1.0

Keywords: demo, graphic

Demo of the FXTools suite of VB controls (fxlabel.vbx and fximage.vbx). An impressive collection of wipes, fades, block text, drop shadows, etc.

Grinning Jack Deck

Control: vbcards.dll Archive: vbcards.zip Author: Richard R. Sands Price: \$0.00

Version: 1.01p Keywords: game

Provides a bitmap collection of cards, including a joker, and basic card API.

GT Icon

Control: gticon.dll Archive: gticon.zip
Author: George R. Torralba
Price: \$0.00

Version:

Keywords: icon, drag-drop

Assigns and retrieves the DragIcon property of controls.

GT List Box

Control: gtlist.vbx Archive: tlstvbx2.zip

Author: George R. Torralba Price: \$15.00

Version: 2.0

Keywords: list, graphic

List box with some extra properties to let you set tab positions, control the existance of scroll bars, color items in the list, or associate bitmaps with items. [Free for non-commercial use.]

GT Toolbar Kit

Control: gttbar.vbx Archive: gttbar01.zip Author: George R. Torralba

Price: \$15.00 Version: 1.0

Keywords: toolbar, graphic, status

GT Toolbar provides a toolbar button, represented by a cell of a toolbar bitmap. Registered users can use the picture property to define their own toolbar graphics. (You can't force the button to stay in down state, unfortunately.) GT Panel is a stripped down 3d panel useful for as a container for toolbars or status boxes.

Ini File Manager

Control: inicon2.vbx Archive: inicon26.zip Author: Mabry Software Price: \$5.00

Version: 2.6 Keywords: ini

Provides an interface to reading and writing ini files, including win.ini, or application specific ini

files.

InpOut

Control: inpout.dll Archive: inpout.zip Author: Jay Munro Price: \$0.00

Version: Keywords: io

> An INP and OUT replacement, written in assembler and used like the QuickBasic routines. Includes source. (For some reason Mr. Munro saw fit to include Software Assist's SCFILE package -- the dll is actually very small.)

JoyStk

Control: joystk1.vbx? Archive: joystk10.zip Author: Mabry Software Price: \$15.00

Version: 1.0 Keywords: io

Provides an interface to up to two joysticks.

MailSlot

Control: mslot1.vbx Archive: mslot10.zip Author: Mabry Software Price: \$30.00

Version: 1.0 Keywords: mail

Mail slot interface.

Menu Event

Control: menuev2.vbx Archive: menuev21.zip Author: Mabry Software Price: \$10.00

Version: 2.1

Keywords: menu, status

Emits menu events while the highlight travels over entries in the menu bar, before the _click event is called. Good in combination with dynamic status boxes.

Message Blaster

Control: msgblast.vbx Archive: tbox100.zip Author: Ed Staffin Price: \$0.00

Version: 1.1

Keywords: toolbar, graphic

Provides a floating palette, complete with tiny title bar, which you can use in conjunction with

an MDI form. Message notification is rather crude and hacky.

MhFormScroll

Control: mhfs200.vbx Archive: mhfs200.zip Author: MicroHelp Price: \$0.00

Version: 2.0 Keywords: scroll

Add scroll bars to a form or a container. Crashed my computer, so I don't know if it works.

MListBox

Control: mlistbox.vbx Archive: mlist110.zip Author: Mike Warning

Price:

Version: 1.1 Keywords: list

Multiple selection list box with ability to find strings, associate numeric data with list items, and set tabs with some precision. Variable pricing scheme.

MouseWatch

Control: mwatch.dll Archive: mwatch.zip Author: User Friendly, Inc. Price: \$0.00

Version:

Keywords: mouse, status

Dynamically tracks mouse position, emitting _KeyDown events to the form. Good for dynamic

hinting, a la Word Perfect.

OpenDlg

Control: opendlg.vbx Archive: opendl.zip Author: Zane Thomas Price: \$0.00

Version:

Keywords: graphic

Does the same thing as cmdialog.vbx.

PBCIone Windows Library

Control: pcbwin.dll Archive: pcbwin.zip Author: Thomas Hanlin III Price: \$19.95

Version: 1.0

Keywords: math, utility

A suite of utility routines: number of floppy or comm ports, checksums, bit operations, etc.

Percentage Bar

Control: percnt2.vbx Archive: percnt23.zip Author: Mabry Software

Price: \$10.00 Version: 2.3

Keywords: graphic, status

Very nice 3D style percentage bar, effectively replacing threed's flooding SSPanel. Doesn't have wierd flood types like SSPanel (circular, right to left), but does include text color reversal over the flood, bevelled floods, and no flashing at all. A much more standard look.

Prompt

Control: prompt.vbx Archive: prompt11.zip Author: Andrew S. Dean Price: \$15.00

Version: 1.1 Keywords: cli

Textbox variant for command-line-style input. Includes argument parsing into words and a

history capacity.

QCards

Control: qcard.dll Archive: qcard.zip
Author: Stephen Murphy
Price: \$0.00

Version:

Keywords: game

Deck of cards with card support functions. Can work with 2 decks at a time, no jokers.

RoText

Control: rotext1.vbx? Archive: vbrotfnt.vbx Author: Mabry Software Price: \$15.00

Version:

Keywords: label, font, graphic

Provides rotatable labels, TrueType only.

SoundX

Control: soundx1.vbx Archive: soundx12.zip Author: Mabry Software Price: \$10.00

Version: 1.2

Keywords: matching

Metaphone and Soundex text matching algorithms let you search by phonic affinity.

spSound

Control: winsound.dll Archive: spsoun.zip Author: Alfred J. Giordano Price: \$0.00

Version:

Keywords: sound

Provides low-level port-based sound routines.

ToolButton

Control: toolbutn.vbx Archive: vbtool20.zip Author: Brett Foster

Price: \$0.00 Version: 2.0b

Keywords: toolbar, help, graphic

Full-feature toolbar buttons, with up to 6 states (for attributes). Use your own image and break it into cells of graphic buttons, or use the suite of standard buttons. Also includes ContextHelp control (same vbx) to assist with help management.

VBCTL3D

Control: vbctl3d.vbx Archive: vb3d.zip (?)

Author: Bernd Beeks & Jeff Sims

Price: \$29.00 Version: 1.32 Keywords: graphic

> When added to a form, transforms standard controls into embedded, 3d controls. Covers labels, message boxes, check boxes, even menus and user-specified controls (by class name). Does not allow you to specify bevel width or depth.

VBPoint

Control: vbpoint.dll Archive: vbptr.zip Author: Jonathan Zuck Price: \$0.00

Version: Keywords: api

Two routines: convert long pointers (LP) to VB strings, and copy strings to another address

(another LP).

VideoSoft Custom Control Library

Control: vsvbx.vbx Archive: 3dctrls or v Author: VideoSoft Price: \$45.00 Version: 2.2a

Keywords: matching, graphic

Three controls: 3D Elastic, a smart container which resizes it's contents automatically, embeds contained controls in true 3d style, and can be nested to provide code-free window splitter bars; Awksome, a text parser based on the AWK language; and IndexTab, which groups controls with a hypercard looking tabbed notepad.

VTSocket

Control: vtsocket.vbx Archive: vtsocket.zip

Author: Visual Technology Products Price: \$50.00

Price: \$50.00 Version: 1.0b Keywords: comm

Windows sockets support. Does not support UDP sockets, out of band, or broadcasting.

WinSock

Control: vbwsk.vbx Archive: vbwsk01a.zip Author: Brian Syme Price: \$0.00

Version: 0.1a Keywords: comm

Provides access to Windows Sockets API.

ZipInf

Control: zipinf1.vbx Archive: zipinf10.zip Author: Mabry Software Price: \$10.00

Version: 1.0

Keywords: compress

Provides thorough information about the files in a zip Archive. Does not uncompress files or deal with other sorts of Archives.

Note

From this issue of the FAQ I introduce symbols in topic header and TOC:

- [++] means topic is updated in this issue
- [**] means topic is new in this issue

Hope this makes it easier for Our Regular Readers ;-)

Commercial Visual Basic for Windows Products

The next release will be produced from an Access database that will be available from CICA. I will also be releasing a viewer program with some Query by Example capabilities. This has been delayed by work schedules. I added some more information.

This is the only control that I am aware of that offers Query by Example. It is a very impressive and stable tool. The error handling is more robust than the JET engine. It over 30 databases but I only tested a few. They all worked fine. I really like the ease of use but there are more tools available for the JET engine.

Paradox Engine

Author: Borland International

Price: \$495 Version: ?? Royalties: ??

Keywords: DLL PARADOX

I used this with C and found it to be very reliable and reasonably quick.

Visual Basic Pro

Author: Microsoft Price: \$495 Version: 3.0 Royalties: None

Keywords: Data-Access VBX

Comment: The JET engine is the standard.

This is the standard. You need the data access control for many of the third party tools. It is the engine supplied with Access 1.0. The biggest problem that I have is the lack of support for Access security. The phone support is impossible but I like the Fax Back support.

Demo File: HLPBRZ.ZIP on CICA KeyWords: HELP WINWORD

This program creates help files and needs Word for Windows 2.x or 6.x. There are benefits to using a program that needs Winword since you can import your manual and turn it into your help file. The program runs on top of Word by adding a toolbar and more selections to your pulldown menus. The jumps are simulated quite well. The icons on the new toolbar are just the first letter of the command so its good that it has popup help balloons.

Word

Author: Microsoft Price: \$495 Version: 6.0 Royalties: \$495

Keywords: OLE WP TEXT SPELL

OLE Automation requires WordBasic and the documentation is hard to find. It performs much faster than DDE once you get past loading word. Another massive product from Microsoft.

USER INTERFACE LIBRARIES

3D Gizmos

Author: MicroHelp Price: \$9.00 Version: ?? Royalties: None

Keywords: VBX UI DATA-AWARE

The look is very nice but the lookups cause a lot of overhead in loading a screen. It preloads all the lookup data so a few good sized lookups and your user will fall asleep waiting for the screen.

If you like msgblast.vbx, you'll love this tool. It allows you to do some amazing things with VB that you thought would require C++. The examples are quite impressive. The other capabilities like checking to see how much resources are being consumed are very useful. Basically, this allows you to do anything that can be done in Windows using VB. This is at the expense of making it much easier to crash Windows.
