## KillNBP Clarification

Networking

M.NW.KillNBP

Written by: Mark Bennett

August 1, 1988

This technical note clears up some confusion regarding the Name Binding Protocol KillNBP function.

---

The description of the `PKillNBP` function on page 519 of *Inside Macintosh Volume V* is somewhat confusing. The data type of the parameter `thePBptr` is incorrectly given as `ATPPBptr` and the pointer to the queue element from the NBP call to be aborted is incorrectly given as being passed in `aKillQEl`. The following is a correct description of the `KillNBP` function:

### KillNBP function

FUNCTION `PKillNBP` (`thePBptr`: `MPPPBPtr`; `async`: `BOOLEAN`) : `OSErr`;

Parameter block

→	26	<code>csCode</code>	word	Always <code>PKillNBP</code>
→	28	<code>nKillQEl</code>	pointer	Pointer to queue element
