

Quad Monolithic SPST CMOS Analog Switches**Features**

- $\pm 15\text{-V}$ Analog Input Range
- Low On-Resistance: $60\ \Omega$
- Fast Switching: $130\ \text{ns}$
- Low Power Dissipation: $30\ \text{nW}$
- CMOS Logic Compatible

Benefits

- Full Rail-to-Rail Analog Signal Range
- Low Signal Error
- Wide Dynamic Range
- Single or Dual Supply Capability
- Static Protected Logic Inputs

Applications

- Portable and Battery Powered Instrumentation
- Communication Systems
- Computer Peripherals
- High-Speed Multiplexing

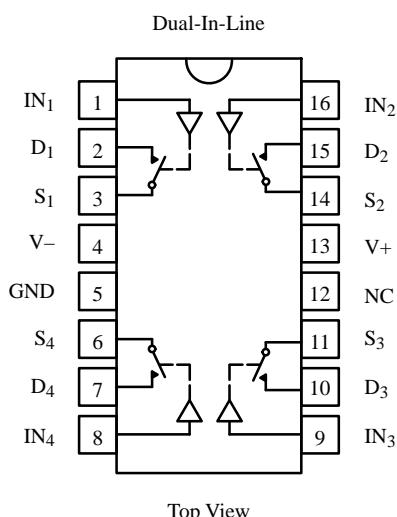

Description

The DG308A and DG309 are quad single-pole single-throw analog switches designed for high speed switching applications in communications, instrumentation, and process control. This series is well suited for applications requiring a low on-resistance over the entire analog range.

Featuring low on-resistance ($60\ \Omega$) and fast switching ($130\ \text{ns}$), the DG308A is supplied in the “normally open”

configuration while DG309 is supplied “normally closed”. Input thresholds are high voltage CMOS compatible.

Designed with the Siliconix PLUS-40 CMOS process to combine low power dissipation with a high breakdown voltage rating of 44 V , each switch conducts equally well in both directions when on, and blocks up to the supply voltage when off. An epitaxial layer prevents latch up.

Applications

Single Supply Operation

The DG308A and DG309 will switch positive analog signals while using a single positive supply. This will allow use in many applications where only one supply is available. The trade-offs or performance given up while using single supplies are: 1) increased $r_{DS(on)}$ and 2)

slower switching speed. As stated in the absolute maximum ratings section of the data sheet, the analog voltage should not go above or below the supply voltages which in single supply operation are $V+$ and 0 V.
