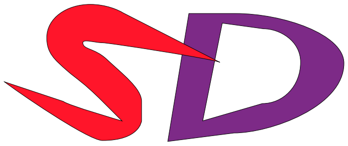
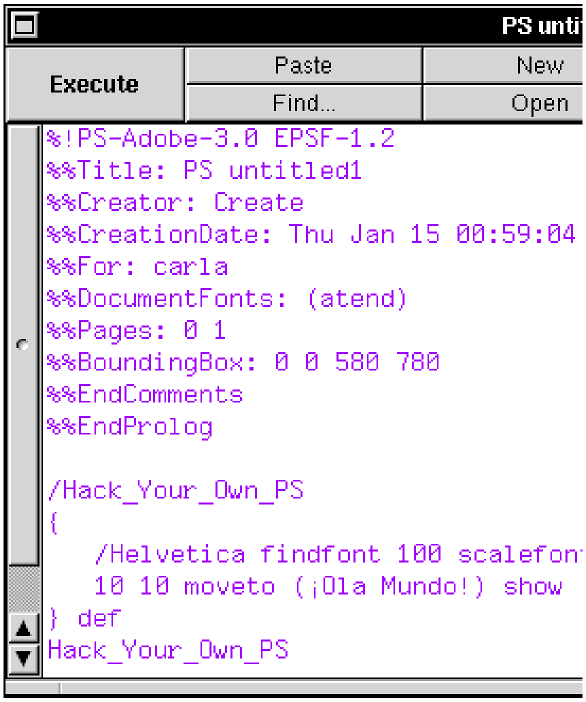
Create offers two text types, Super and Paragraph. Super Text has its own set of five effects: rose, circle, upper and lower arc, and binding to any spline object. Super Text accepts all of the great special effects that **Create** supplies for graphical objects. Paragraph (Rich) Text can be formatted with different typefaces, families, sizes and ruler settings within an object, as well as different colors per character—features you'd expect only from a word-processing application! Either text can turn ordinary fonts into manuipulatable splined objects.

Rich **text**, in any
number of colors
and ruler settings
per object



Create's unique User PostScript feature lets advanced users (or users who'd like to learn more about PostScript) view, directly edit and repeatedly execute the PostScript code associated with any object created in or imported into **Create**.



```
%!PS-Adobe-3.0 EPSF-1.2
%%Title: PS untitled1

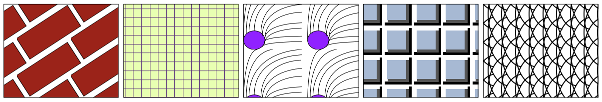
```

Some recent additions to **Create**'s already phenomenal feature list include:

Object-linking: Control-drag EPS, TIFF and RTF files to create a link to the original; Paste and Link **Create** images into other applications.



Patterns: PostScript Level 2 patterns that you create and edit just like any other graphic in **Create**!

On-line Help: Help-click anything you see in **Create**, and the Help panel will appear with specific information.

On-line Manual: A digital manual for easy access information and pictoral instructions.

Paintbrush tool: Drag a pattern, smear a color.

Multiple pages: Add, duplicate and reorder multiple pages in a single document.

Presentation: Display your pages in sequence at a user-defined pace.

Date and Page Markers: Date-text graphics can update automatically or remain fixed at the date you enter; smart page-number graphics update on every page when you color, reformat or otherwise edit just one!

DataWell: Extensive interapplication connectivity is another way in which **Create** exploits the power of NEXTSTEP: **Create** can import EPS, TIFF, TextArt images and documents, and Adobe Illustrator images. **Create** can also export images, objects and whole documents as RTF, ascii, PostScript, Create, Tiff or EPS images with a simple drag and drop pop-up menu.

by

Create from Stone Design is the most intuitive and fun-to-use full-color , multiple page drawing program available for NEXTSTEP. It lets you compose 2.5-dimensional text and objects using all of the high-end tools and effects you'd expect from a professional package, yet remains remarkably easy to use. These data sheets were produced entirely in Create!

Create's extensive tool palette includes a wide variety of standard graphical objects—straight and constrained straight lines, curves, arcs, three types of spline objects, rounded and straight rectangles, ovals, circles and freehand—plus two types of text objects, all of which are treated as objects that can be moved, resized, modified and grouped with other objects with a click of the mouse. **Create** is also a great entry-level layout and business-graphics program, offering tools that make precision placement of objects a snap: User-definable grid and ruler controls in your choice of units, unlimited zooming, grouping, and locking—plus several unique and powerful alignment controls, nudging, layering and redraw features—all make **Create** well-suited for business and scientific graphics applications.

Every object in **Create** has a set of associated inspectors that make it easy to edit the unique characteristics of that object and also to apply and control special effects. The inspectors serve as intuitive front ends to the PostScript parameters of an object. Here are just a few of **Create**'s inspectors:

Create has a suggested retail price of $495, which includes sample files, sample patterns and extensive on-line help. **Create** is available directly from Stone Design, 3725 Rio Grande Blvd. NW, Albuquerque, NM 87107 USA.
