

# *Okapi*

---

Welcome to *Okapi*, the **O**pen **K**eystone **A**pplication **P**rogramming **I**nterface.

**Tailor**, the visual PostScript editor, supports dynamically loadable extensions, called *keystones*. Keystones provide additional or optional functionality, leveraging the power of the base application. The specification of how to develop keystones for Tailor is called *Okapi*. It is freely available to all interested Tailor users, and it is provided in this development package.

*Okapi* provides full access to the majority of **Tailor's** functions, and allows complete integration of additional functionality in the existing user interface. Have fun !!
