### RELEASE 1.1r

**This release of Graphic Workshop for Windows includes the following new features and updates:**

⌘ Graphic Workshop now features the extraordinary Pegasus JPEG libraries. This has reduced the read and write times for JPEG images and improved the image quality for JPEG-compressed files. See GWS Documentation for more about Pegasus.

⌘ Added PNG support. Please consider converting your GIF files to PNG... it will save you some disk space and help free the high seas of pirates.

⌘ Added MPEG support. Note that you must have Windows 95, Windows NT or WIN32 installed in Windows 3.1 for the MPEG functions of Graphic Workshop to run. This is somewhat preliminary MPEG, with more to come in the next release.

⌘ Got graphic Workshop ready for Windows 95.

⌘ Added a graphic button bar, with tips. This has allowed us to get more buttons in the button bar. Note that if you prefer the old text buttons you can have 'em back -- open the Setup dialog and turn off the Graphic Button Bar item.

⌘ Added a switch to allow hidden directories in the main file selector. What's lurking in those hidden directories...

⌘ Added a directory history to the File menu.

⌘ Added an elusive Config button to the Print dialog. Really... it was there all along, but it was hiding.

⌘ Plus several performance enhancements...

**There have been numerous other minor changes to this version of Graphic Workshop... as well as a few bug fixes. Please consult the GWS Documentation file for a more complete list of them.**
