What is ModPlayer ?

ModPlayer is a music program which is capable of playing .MOD music files. This format was originally developed for Amiga computer but today you can use these files with Macintosh, Atari ST and PC. This file format's strongest points are good sound quality and compact size.

Why should I use ModPlayer ?

There are several sound-tracker programs available for Macintosh. Antoine Rosset's Player Pro and Frank Seide's Sound-Trecker are widely used and well known programs. They offer great number of features and therefore they use a lot of hard disk space. ModPlayer was designed to be small but it still offers many useful features.

Required

System 7.0 or later

68020 processor or better

1000 Kb free RAM

Recommended

External speakers or headphones

256 colors/grays

ModPlayer is not tested with multiple monitors, PowerPC or System 7.5.

Apple menu

About ModPlayer...Shows information about ModPlayer.
