

***This error is similar to a "Type 4" error. It differs slightly since it indicates a "Divide by Zero" operation involving a real (decimal) number rather than an integer number.***

***The error could indicate that your System file is corrupted.***

***What to do***

***You should review the explanation of error "4" (using the "Mac OS Errors" option of the Tools menu).***

***If you suspect that the System file is corrupted, try re-installing it. If that fails to solve the problem, you are probably having a hardware failure. The System file can appear to be corrupted because of bad RAM or a bad disk. These possibilities can only be evaluated with certainty by an Apple Repair shop. Consider having your system examined if you don't feel capable of doing it yourself.***
