About LiveUpdate

LiveUpdate allows you to update your version of Norton Uninstall Deluxe automatically and downloads program enhancements to address issues that have emerged since the program was released.

To use LiveUpdate, your computer needs a modem or an Internet connection. To start LiveUpdate manually, select it from the Norton Uninstall Deluxe Start Menu group, or open Norton Uninstall and select LiveUpdate from the launchpad. LiveUpdate wizards walk you through the updating process.

About Norton Uninstall Deluxe options

Norton Uninstall Deluxe lets you specify options for the following:

{button ,JI(`nudeluxe.hlp>task',`To_specify_Norton_Uninstall_general_options')} **General options**

   Specify global settings for Norton Uninstall Deluxe, such as launchpad display options, level of SafetyScan, drives to scan, and the default backup and copy directories.

{button ,JI(`nudeluxe.hlp>task',`To_specify_system_monitoring_options')} **System Monitor options**

   Specify settings for monitoring your system during program installations, such as enable or disable automatic monitoring and InstallGuard Undo file options.

{button ,JI(`nudeluxe.hlp>task',`To_specify_AutoClean_options')} **AutoClean options**

   Specify when to clean files automatically and what file categories to include in the cleaning process.

{button ,JI(`nudeluxe.hlp>task',`To_specify_file_cleanup_options')} **File Cleanup options**

   Specify what categories to include, which file types to display, whether to create a backup, to remember selected categories, and to create custom file cleanup categories.

{button ,JI(`nudeluxe.hlp>task',`To_specify_duplicate_file_cleanup_options')} **Duplicates Cleanup options**

   Specify what file types to search for during duplicate file cleanup.

{button ,JI(`nudeluxe.hlp>task',`To_specify_Registry_Cleanup_options')} **Registry Cleanup options**

   Specify what registry categories to search for when cleaning up the registry.

About the System Monitor context menu

System Monitor monitors your system automatically during program installations. When System Monitor starts, the System Monitor icon appears in the Windows taskbar. Right-click this icon, to select these these options from the context menu:

- **Close**: Exit System Monitor.
- **Run setup**: Start the installation for a program.
- **Undo Install:** Uninstall the last program installed with InstallGuard. This option is only available if there is a current InstallGuard program available.
- **Accept Install:** Accept the last program installed with InstallGuard. This option is only available if there is a current InstallGuard program available.
- **Options:** Specify System Monitor options.

{button ,AL(`About Accept Install;About InstallGuard;About System Monitor;About Undo Install',0,`',`')}   Related Topics

About SafetyScan

The first time you start Norton Uninstall Deluxe, SafetyScan builds the files database. This process may take several minutes because every file on your system is examined and file interdependencies are resolved. The SafetyScan database lets Norton Uninstall Deluxe safely manage files and programs.

The file interdependency information in the files database tells Norton Uninstall Deluxe how the files on your system are related to each other. The database shows all files associated with every .EXE, .DLL, and .DLL variant (such as .OCX, .VBX). For example, if you have Word for Windows installed on your system, SafetyScan shows which files are used by Word for Windows. It also indicates whether those files are associated with any other files on your system.

SafetyScan can perform the following types of scans:
- **Standard:** Scans all system files and reads all .EXE and .DLL headers.
- **Thorough:** Scans .EXE and .DLL headers, and entire .EXE files to find called programs and files not identified in the headers. A thorough scan takes longer than a standard scan, but it provides the detailed information that Norton Uninstall Deluxe needs to delete programs and files safely. This is the default setting.

To change the scan type, click Options on the Norton Uninstall Deluxe launchpad.
This scan must be completed in order for you to safely add or delete files and programs, or to move or copy programs.

Every time you start Norton Uninstall Deluxe, the SafetyScan files database is updated. The update of the SafetyScan database is necessary for Norton Uninstall Deluxe to learn about any changes made to your system since the last time you used Norton Uninstall Deluxe.

{button ,AL(`About Update SafetyScan;To update SafetyScan',0,`',`')}   <u>Related Topics</u>

About color coding in File and Duplicates Cleanup

File Cleanup and Duplicates Cleanup color code their file lists to indicate to you whether files are safe. The colors indicate the following:

- **Red With Yellow:** These files are considered critical to the proper operation of the system. You cannot delete these files using Norton Uninstall Deluxe.
- **Red:** Do not delete these files. These files are important to the operation of one or more applications.
- **Yellow:** Use caution when deleting these files.
- **Green:** These files are safe to delete according to the criteria defined in the Advice tabs. Review the color-coding definitions in the Advice tab to understand why these items are marked as safe to delete.

{button ,AL(`About Duplicates Cleanup;About File Cleanup;To clean up duplicate files;To clean up files automatically;To create Duplicates Cleanup custom categories;To create File Cleanup custom categories',0,`',`')}   Related Topics

About File Cleanup categories

The following are the files types searched during File Cleanup and their color coding criteria:

○ **Archives** : Compressed backups of other files (also called zip files). Once the compressed files within an archive are extracted, the archive can usually be deleted. Deletion of Archives, if included in a backup, does not free up disk space. Files with the following extensions are included in the category: .ARJ, .ARC, .CAB, .GZ, .LZH, .TAR, .TAZ, .TGZ, .Z, .ZIP, and .ZOO. Archives are color-coded based on the accessed and modified dates specified in the File Cleanup options.

○ **Backup Files:** Backup files are created by other programs as a method to store an older version of a file. Primarily files with the .BAK and .OLD extensions will be included. Backups of system files, such as WIN.INI, SYSTEM.INI, CONFIG.SYS and AUTOEXEC.BAT are also included. All backup files, with the exception of those created in the last 24 hours will be color-coded green and safe to delete.

○ **Cursors and Icons:** Cursor files define the shape of the cursor. Icon files are used by other programs for a variety of purposes. Files with the .ANI, .ICO, and .CUR extensions are included. Cursors and Icons are color-coded based on the accessed and modified dates specified in the File Cleanup options.

○ **Download Folders:** Files located in the America OnLine and CompuServe download folders are listed here.

○ **Empty Folders:** All folders that contain no files are included in this category. All Empty Folders are color-coded yellow or red and must be deleted with caution. Do not automatically delete all empty folders. For example, some applications create empty folders for storing temporary files. While the application is running, temporary files are stored in the folder. All files in the folder are then deleted when the application is closed.

○ **Fonts:** Font files are used by Windows to draw text and other symbols. Files with the .FON, .FOT, and .TTF extensions are included. Fonts are color-coded based on the accessed and modified dates specified in the File Cleanup options.

○ **Graphic Files:** This category lists all common graphic file formats used by various applications. These graphic files are commonly found in clip art collections. Files with the following extensions are included in this category: .BMP, .CDR, .CGM, .DIB, .EPS, .GIF, .JPG, .PCD, .PCT, .PCX, .TGA, .TIF, and .WMF. Graphic files are color-coded based on the accessed and modified dates specified in the File Cleanup options.

○ **Help Files:** Help files provide on-line assistance for programs. They are usually quite large and can safely be deleted without damaging a program. However, only delete those help files that you do not use. Help files with the extensions .HLP and .CNT are color-coded based on the accessed and modified dates specified in the File Cleanup options. Help support files (.FTS and .GID) are generated by the help files. These are always color-coded green as safe to delete.

○ **Internet Cache Files:** Every time you browse the internet, files are created in the Internet Explorer cache folder or Netscape Navigator cache folders. These files are necessary only when browsing a particular page or while connected to the Internet. The files located in these folders are always color-coded green as safe to delete.

○ **Lost Cluster Files:** Lost cluster files are created by disk scanning utilities when repairing lost clusters on the system. All lost cluster files, with the exception of those created in the last 24 hours, are color-coded green as to delete.

○ **Multimedia Files:** Multimedia files are files used to play video and sound. These files are usually large in size and can be deleted safely. Files with the following extensions will be included: .AVI, .MID, .WAV, .FLC, .MOV, .RAM, .AU, and .AIF. Multimedia files are color-coded based on the accessed and modified dates specified in the File Cleanup options.

○ **Readme Files:** Readme files contain program and product update information. These files are not necessary to the operation of the program, but may contain valuable information that you should review before you delete them. Files with the filename

README.* are included. Readme files are color-coded based on the accessed and modified dates specified in the File Cleanup options.

🟡   **Screen Savers:** A screen saver is designed to prolong the life of your monitor screen. All screen savers, with the exception of the screen saver currently in use, are color-coded green as safe to delete.

🟡   **Setup Files**: Setup files are used by programs during installation. These files can usually be deleted safely. However, setup files may be needed to add options or configure a program at a later date. Setup files are color-coded based on the accessed and modified dates specified in the File Cleanup options.

🟡   **Temporary Files:** Temporary files are created by programs to temporarily store data. If the program is abnormally terminated these files are usually left behind. All temporary files, with the exception of those created in the last 24 hours, are color-coded green as safe to delete.

🟡   **Text Files:** Text files usually contain program and product update information. These files are not necessary to the operation of the program, but may contain valuable information that you need to review before you delete them. Files with the extensions .TXT and .WRI are included. Text files are color-coded based on the accessed and modified dates specified in the File Cleanup options.

🟡   **Zero Byte Files:** Files with a size of zero bytes. The file MSCREATE.DIR is excluded from this list as it is needed by the Acme setup and de-installation programs to identify file and folder location. All zero-byte files are color-coded green as safe to delete.

🟡   **Disconnected Executables:** All .EXE files that are not connected to the Desktop or Start Menu are listed here. Just because these files are disconnected does not mean they are safe to delete. They may be needed by other program files. Use great caution when selecting these files for deletion.

🟡   **Disconnected Shortcuts:** Disconnected shortcuts are those links that no longer point to a valid file or program on the system. All disconnected shortcuts are color-coded green as safe to delete.

🟡   **Custom File Cleanup Categories:** You can create custom categories to include in File Cleanup to quickly locate files of a certain type. Custom categories are color-coded based on the accessed and modified dates specified in the File Cleanup options.

About Undo Install

Undo Install allows you to uninstall the program you last installed with System Monitor using InstallGuard. When you undo an installation, Undo Install deletes the program and restores your system to its previous configuration. Use Undo Install if you find that a newly installed program has caused an existing program to malfunction, or if you decide you do not want to keep a program monitored with InstallGuard.

InstallGuard is only available for one program at a time. Once you choose to use InstallGuard for a program, any existing backup created by InstallGuard is overwritten. You can still remove, move, store or copy any program monitored by System Monitor, but you cannot restore overwritten files and registry entries.

To take full advantage of Undo Install, start the installed program immediately after installation. Also start other programs on your system to ensure that the latest installation did not damage existing programs.

{button ,AL(`About System Monitor;About Monitor Installation;About Accept Install;About InstallGuard;To undo installations',0,`',`')}   Related Topics

About Accept Install

Use Accept Install to keep a program monitored by System Monitor using InstallGuard. The newly installed program and any additions and changes made during the installation can no longer be uninstalled using Undo Install. You can still remove, store, move, or copy any program monitored by System Monitor, but you cannot restore overwritten files and registry entries.

To take full advantage of Accept Install, start the program immediately after installation. Also start other programs on the system to ensure the installation did not damage existing programs.

You can only have one program at a time available for Accept Install.

{button ,AL(`About System Monitor;About Monitor Installation;About InstallGuard;About Undo Install;To accept installations',0,`',`')}   Related Topics

About Norton Uninstall Deluxe reports

Norton Uninstall Deluxe records all actions and operations performed with Remove, Move, Store, Copy, AutoClean, File Cleanup, Duplicates Cleanup, Registry Cleanup, and System Monitor.

By default the information displayed in Reports is a report summary of the log you are viewing. The information includes the number of files removed, the total size of files removed, and a backup name and location. The type of information displayed in this summary is dependent on the type of operation log you are viewing.

The Reports dialog box can also display a file analysis of statistics related to the number of files. The information displayed depends on the type of action you view the report for. For example, if you are viewing reports for removed files, the Reports dialog box displays total number of files deleted and a breakdown of files by type.

You can also view a disk analysis with statistics related to disk space. Again, the information displayed depends on the type of action you view the report for. For example, the Master Log displays the disk space regained by Remove, Store, File Cleanup, Duplicates Cleanup, and AutoClean, as well as total disk space gained.

A graphical summary is also displayed to the right of the report summary. A pie chart shows you how much disk space was regained with the operation in comparison with the overall disk space gained using Norton Uninstall Deluxe.

The lower half of the Reports dialog box displays a detailed listing of all files and registry entries, and the actions taken on those files and entries.

About Norton Remove

Use Remove to delete a program you no longer use or want. Remove analyzes a program and identifies all program files, folders, registry entries and system files that are associated with that program. Remove then deletes only those files, folders and entries that can safely be removed from the system. You also have the option of creating a backup of the deleted program so you can restore the entire program or only select files if necessary. We strongly recommend that you create a backup at all times.

About Norton Move

Use Move to change the location where a program has been installed. Move is especially useful if you want to move a program to a new partition, removable media or a second hard drive. It saves you the time of deleting and then reinstalling a program.

Move analyzes a program and identifies all program files, folders, registry entries and system files that are associated with that program. Move then moves the appropriate program files, folders, and subfolders to the new location and automatically updates the program settings for you to reflect the program's new location.

If you select a single program to move, the specified destination folder becomes the new program folder. For example, assume you selected MYAPP.EXE located in the C:\MYAPP FOLDER, then specified D:\MYNEWFOLDER as the destination. In this case, all program files would be copied to D:\MYNEWFOLDER which becomes the new program folder for MYAPP.EXE.

If you select multiple programs to move, the program files are copied to the destination folder using the existing file and folder structure. For example, assume you selected a program group with two programs: APP1.EXE (located in C:\FOLDER1) and APP2.EXE (located in C:\FOLDER2). You select D:\MYAPPS as the destination drive and folder. App1 would be moved to the D:\MYAPPS\FOLDER1 folder and App2 would be moved to the D:\MYAPPS\FOLDER2 folder.

　　　　You cannot modify the files to be moved or the configuration files to be updated.

About Norton Store

Use Store to remove and create a backup of infrequently used programs. Store analyzes a program and identifies all program files, folders, registry entries and system files that are associated with that program. It then creates a backup of that program and deletes all files that can safely be removed from the system.

The icon of the stored program is replaced with a special icon to indicate that the program has been stored. When you need to use the program again, simply select the program's icon from the Start Menu or Explorer, and Norton Uninstall Deluxe restores and starts the program for you.

About Norton Copy

Use Copy to make a copy of a program on one system, including its configuration, that can be restored on another system. Copy analyzes a program and identifies all program files, folders, registry entries and system files that are associated with that program. It then creates a self-extracting executable at an intermediate location, usually floppy disks or removable media. You can then restore the program from the intermediate location to another system.

   Refer to your software licensing agreement to insure copying an application to another computer is allowed.

About Registry Cleanup

Registry Cleanup guides you step-by-step to locate invalid registry entries and delete them from the Windows registry. These invalid entries point to files and folders that may have been deleted or moved. These invalid entries can normally be removed safely and in many cases, their removal can speed up system operation and even resolve problems. To use Registry Cleanup, select Registry Cleanup from the Disk Cleanup section of the Norton Uninstall Deluxe launchpad.

About System Monitor

Norton Uninstall Deluxe's System Monitor tracks changes made to the system during a program installation. This provides Norton Uninstall Deluxe accurate information when removing programs from the system or copying programs from one system to another. Use System Monitor to monitor the installation of all programs added to your system.

System Monitor also provides InstallGuard. InstallGuard allows you to install and use a program on a trial basis without permanent risk to other programs on your system. System Monitor tracks the installation of a program, logging all changes and creating backups of any overwritten files or registry entries. If you discover the installation of a program has prevented an already existing program from operating properly, or you decide you do not want to keep the program on your system, you can undo the installation. This not only deletes the program, but it restores your system to its previous configuration, prior to the installation of the program.

About Disk Info

Disk Info allows you to view the disk usage (free space and used space) for any available drive on your system.

Select any available drive to view the disk space statistics for that drive. When a folder is selected in the folder breakdown for the drive, that folder's disk usage information displays beneath the drive's statistics. The information includes the amount of space the selected item takes up.

Select Include Subfolders to include the statistics for all subfolders and files contained within the selected folders. This also displays details about the number of folders and files contained within a selected folder.

You can also select a specific file to view its disk space usage on a selected drive.

Disk Info can help you identify potential drives in need of cleaning. As well as keep you up-to-date on your available drives' statistics.

About Monitor Installation

Monitor Installation allows you to monitor program installations, if System Monitor is not running and automatically detecting installation programs.

To use Monitor Installation, select System Watch from the Norton Uninstall Deluxe launchpad. Then select Monitor Installation.

When selected, a dialog prompting you for the program installation filename is displayed. You can specify the name of the installation program by typing the path and filename in the edit field, or you can browse for the program by clicking Open.

After you specify the installation program name, click OK, and System Monitor starts the installation program and records all file additions and system changes.

{button ,AL(`About System Monitor;To monitor installations automatically with System Monitor;To monitor installations manually with Monitor Installation;To specify system monitoring options',0,`',`')}   Related Topics

About InstallGuard

With InstallGuard, you can now install a program on your system without fear that it will damage your favorite programs or your system.

Periodically, the installation of a program can prevent an existing program on the system from working properly. In the past, to regain use of that crippled program, you would have to uninstall the problem program and reinstall the now broken program. However, this did not always repair the damage.

When System Monitor detects an installation program, you are prompted to allow System Monitor to monitor the installation program. After clicking Yes, you are then given the option to use InstallGuard.

When InstallGuard is used, a backup is made of any changed registry entries or overwritten files that can affect other programs on the system.

If you do not opt to use InstallGuard, System Monitor still monitors the installation program, tracking all file, folder and registry additions so you can remove, move, store, or copy the program at a later date.

Once you have made the decision to keep the program or if you decide you do not want to keep the program, you can then Accept Install or Undo Install.

{button ,AL(`About Accept Install;About Undo Install;To accept installations;To undo installations',0,`',`')}   Related Topics

About Update SafetyScan

To update the SafetyScan files database, without exiting the program and relaunching, select System Watch on the Norton Uninstall Deluxe launchpad. Then select Update SafetyScan from the System Watch options.

When selected, SafetyScan updates the files database and you can then proceed with all other operations.
