Chapter 1

Virus Info Base

1.1 Multilator

Name : Mutilator

Aliases : No Aliases

Type/Size : Boot/1024

Clones : No Clones

Symptoms : No Symptoms

Discovered : 13-10-92

Way to infect: Boot infection

Rating : Harmless

Kickstarts : Only 1.3 with RANGER RAM ! (\$C00000)

Damage : Overwrites boot.

Manifestation: A GFX-Routine

Removal : Install boot.

Comments : The Mutilator Virus only works on a few systems.
As you can see above the virus needs Kickstart 1.3 and a special (FAST)Ram called 'Ranger Ram'.
People who are booting with an infected disk and who can't afford the above mentioned conditions will see a GURU ! But if you have such a Ram + Kickstart the virus will do the following:

- 1) The virus copies itself at \$7FAD0 and changes the coolcapture-vector to stay resident.

After the next reset the virus patches the DoIO() & the Supervisor()-Vector.

The DoIO()-Patch is used to infect other disks. Every time when the Supervisor()-Vector is used by the system, the virus increases a value by 1. If this value reaches 224 (and an other 160) the virus executes a GFX-Routine with an endless-loop. But this routine has an programming-error (Color-Initial Routine is the last S..t!), so you will get an black screen.

After 3 infects the virus gives out an alert:

```
"THIS IS THE NEW MUTILATOR VIRUS !"  
"BY MAX OF STARLIGHT!"
```

This text is crypted, you CAN'T read it in the BB.

Click on this gadget to see a little Demo of the Multilator virus. Push left mouse button to return.

There is another crypted text in the BB which says after decryption:

```
"Thanx to The Executors for Spreading this GREAT code  
! done: -1992-"
```

NOTE FROM ALEX: Sorry Max, I must laugh now. This piece of shit is just lame coded. (You're very likely a Lamer, too.)
