This powerful tool allows you to browse, view and recover all the resources cached on disk by Netscape.

Its use is quite simple, just <u>select a Netscape cache FAT file</u> (index) and <u>refresh</u> the <u>resource list</u> to use all the resources cached by Netscape. You can then <u>view</u> a resource in list, <u>export</u> it (or a selection) to the <u>destination directory</u> or get <u>informations</u> about it.

All the available commands can be accessed using the standard  $\underline{\text{menu system}}$  or the mouse-driven toolbar.

## **Selecting an index**

Changing the reference <u>index</u> for the <u>cached resources list</u> allows you to browse different caches for different Netscape installations on the same PC.

This command pops up a new window for the selection of the desired file. If no <u>index</u> is selected, NCB searches it in the directory currently used by Netscape. To update the list, you must then <u>refresh</u> it.

## Refreshing the cached resources list

If the <u>Auto reload</u> option is not enabled, you need to manually refresh the contents of the <u>cached</u> resources <u>list</u> with this command at startup or after you <u>selected a new index</u>.

You may however need to refresh the list whenever you want to align its contents to the disk cache (after starting or closing Netscape).

The progress of the operation is displayed in the meter panel.

#### **Cached resources list**

This list shows, when  $\underline{\text{refreshed}}$ , all the resources referenced by the  $\underline{\text{selected cache index}}$ . You can  $\underline{\text{view}}$  them, or  $\underline{\text{export}}$  to a  $\underline{\text{destination}}$ .

See <u>Selecting resources</u> to learn how NCB lets you select the resources in this list.

## Viewing the focused resource

When the <u>cached resources list</u> has been refreshed (either manually, with the <u>Refresh list command</u>, or automatically, if the <u>Auto reload</u> option is selected), you can directly focus one of the resources and view it by double-clicking the item, or pressing Enter.

Due to the unavailability of a freeware VCL component or VBX, the view option for JPEG files is not yet implemented (the View focused resource button is disabled).

## **Exporting resources**

When the <u>cached resources list</u> has been <u>refreshed</u>, all the <u>selected resources</u> referenced by the <u>current cache index</u> can be exported to the chosen <u>destination</u>.

If a resource with the same DOS name has already been exported to that destination, a new file will be created for the new resource.

## **Destination**

This panel can be used to specify the directory in which all the resources referenced by the <u>selected</u> <u>cache index</u> can be exported with the <u>export</u> command. You can also create new directories with the <u>Create subdirectory</u> button.

## **Informations about NCB**

This command pops up a dialog with all the informations about the making of NCB.

### **Current cache index**

Cache FAT: C:\WINDOWS\INTERNET\NETSCAPE\CACHE\FAT

The status line displays the currently selected cache index. This can be changed  $\underline{\text{selecting another}}$   $\underline{\text{cache index}}$ .

### **Main menu**

<u>File Edit Select View Options Help</u>

Here follows the description of all the menus.

File menu

Edit menu

<u>About</u>

## **Creating subdirectories**

Create subdirectory

With this command you can create new subdirectories on the fly, to better manage any <u>exported</u> <u>resource</u>. When requested, the button changes to an <u>input line</u> and the <u>destination directory</u> will be the new one entered.

## **Enter a new subdirectory name**

resource	

In this input box you can specify a new subdirectory name. This will be created as a child of the current directory specified in the <u>destination</u> panel.

## **Auto reload option**

When this option is selected, each time you start NCB or  $\underline{\text{select}}$  a new index, the  $\underline{\text{cached resources list}}$  is automatically  $\underline{\text{refreshed}}$ .

## **Getting informations for selected resources**

There are a lot of informations available about the resources, including internet source and cached resource status. You can get these informations for any number of <u>selected resources</u>.

To access the informations panel you can also use the popup menu, obtained with a right click on the  $\underline{\text{cached resources list}}$ 

## **Selecting resources**

You can select a sequence of items dragging the mouse over the list and pressing the left button together with the shift key. To select non consecutive items, you only need to hold down the Ctrl key while clicking each item.

NCB also provides an easy way to select all the resources of the same type in the <u>cached resources</u> <u>list</u>: here we have buttons for the most common file formats, to select all the resources in list, or to select any other entry.

The progress of the operation on selection is displayed in the meter panel.

### **Meter indicator**

This panel shows the completion percentage of the current operation. It is actually active when you are <u>refreshing</u> the <u>cache index</u> or when you requested an <u>extended selection</u> for the <u>cached resources list</u>.

#### **Toolbar**

Here is the description of the toolbar.

Select the cache index

Refresh the cached resources list

View the focused resource

Get informations for the selected resources

Export the selected resources to the destination directory

Show credits for the program

Show NCB help

If you are using the keyboard, you can even get help on the menu system
