mail2yam

1.1   Mail2YAM 1.8

```
                                    YAM 1.3.3a has been released?
              Mail2YAM 1.8 is ready... fast service, uh? ^_^;

                        *** ***      ***** ***    ***
                        ***      *** *** *** ***   ***
     **********   *****  **** ***         *** *** ***   *****   **********
     *** *** ***      ***  *** ***        ***       ***        *** *** *** ***
     *** *** ***   ******  *** ***    ***         ***      ****** *** *** ***
     *** *** *** *** ***   *** ***    ***         ***    *** *** *** *** ***
     *** *** ***   ******  ***  ***** *******     ***      ****** *** *** ***

                   Mail2YAM – Release 1.8
                         User's Manual

              ~~System~Requirements~~
                 What your system should have

              ~~~~~~Introduction~~~~~
                 What is Mail2Yam

              ~~~~~~How~Install~~~~~~
                 want to install my program

              ~~~~~~~~~Usage~~~~~~~~~
```

```
                    How use Mail2YAM

            ~Random~fortune~cookie~
               To be or not to be...

            ~~~~~~Author~Info~~~~~~
               How to reach the author

               Greetings
            People that I want to greet
```

1.2 Please read!

```
                 IMPORTANT NOTICES TO READ
                 =========================
```

1. Since Mail2YAM is free (I don't want money from you), I need a little
help from you all: please if you've problems, before write me, be sure
that you've read the documentation;

2. When you write me please tell me WHAT version of Mail2YAM you're using.

That's all.

1.3 Random Fortune cookies

```
                 Random~fortune~cookies
                 ======================
```

Mail2YAM supports random fortune coockies.
A random fortune coockie is a random (really?) phrase to put at the end of
your mail.

```
                 *** IMPORTANT!!! ***
```

There is a little limitation... each phrase MUST BE one line length.
See "S/Fortune.txt" in this archive to see random fortune cookies format.

However, note that this feature is optional.

1.4 Mail2Yam Usage

```
                 How to Use Mail2YAM
                 ===================
```

Usage: Mail2YAM <prefs|check|mailto> [<pophost> <username> <password>]

prefs   Invokes mail2yam prefs-editor.

Important: every time you launch prefs-editor and you abort the script,
the preference file (S:mail2yam.prefs) will be overwritten, then truncated.
You have to launch prefs-editor again and define all parameters to generate
FULL AND VALID preference file. To see how it works, open a newcli and
enter:

mail2yam prefs

check   Invokes mail2yam check mail.

NOTE: you need to be connected and TCP: device must be already mounted.

Mail2YAM look in your mailbox if you've new messages. If you've mail, M2Y
reports you how messages are in your mailbox, so you can launch YAM to
retrieve your mail; else M2Y simply advise that you have no new mail.

To do this, you need to fill pophost, username and password keywords.
Here is an example:

mail2yam check server.mailbox.com alexursi pass-word

That means that mail2yam try to connect your mailserver server.mailbox.com,
sends your user id alexursi, your password pass-word, then
check in your mailbox for new mails.

mailto   Invokes mail2yam mailto sequence.

Mail2YAM starts mailto procedure.
To do this, you need to fill destination address.
Example:

mail2yam mailto alexursi@luda.livorno.it

That means that mail2yam starts mailto procedure, destination address is
mail2yam author ;-)

I suggest you to try my script locally... it's the best way to know how it
works.

1.5 What is Mail2YAM?

                              What is Mail2YAM?
                              =================

Mail2Yam is the only and the one mailto script replacement for ANY WWW
browser.   This program has been tested on different machines (A1200, A2000
and A4000) and reports NO problems.

BUT if you find a bug, please write me: I will do my best to fix the
problem.

1.6 Copyright

```
                                  Copyright
                                  =========
```

Mail2Yam is Copyright (C)1996 by Fast Freddy, all rights reserved.

Mail2Yam is a freeware program and you are only allowed to freely distribute it, if you let this archive unchanged. No part of this archive is allowed to be distributed with commercial software without a written permission of the author.

1.7 Disclaimer

```
                                        Disclaimer
                        ==========
```

No warranties are made for this program. All use is at your own risk. No liability or responsibility is assumed for any damages occured during the usage of
           Mail2Yam
            . You have been warned.

1.8 System Requirements

```
                        System Requirements
                        ===================
```

'Mail2YAM' 1.8 requires:

* Amiga – the only and the one ^_–;
* OS2.1 or better
* RexxMast running

* rexxreqtools.library (from Aminet)
* rexxsupport.library

* YAM 1.3.3a   (ALREADY installed and assigned)
* a text editor   (Ed, CygnusEd, GoldEd...)^1
* a WWW browser

* TCP device
  already mounted   (If you want to check if you've new mail)

FOOTNOTES

^{1} If you want to use your own editor you MUST know its arexx port name.
For example, CygnusEd's arexx port is named: rexx_ced

1.9 Author Information

```
                         How to reach the author
                         =======================
```

If you have questions, suggestions, bug reports, manga trading or anything
else, you can send e-mails to:

```
     _   _____
 .--/ \--/  _____   :------------------------------------------------.
 | / . \/  / .--:  |  _                                              |

                                                    \/ ._||_| \/
```

1.10 How Install Mail2YAM

```
                              How Install Mail2Yam
               ====================
```

1. Simply copy from this archive "c/mail2yam" to your c: directory.
   Then open a newcli and enter:

   C:Mail2YAM prefs

   And reply to each answer.

2. If you want to install mail2yam on...

```
                      Voyager, click
          here
          .
                      AWeb  , click
          here
          .
                      Ibrowse$^1$, click
          here
          .
```

FOOTNOTES

^{1} Tested only on Ibrowse 1.02 Commercial.

1.11 ... on Voyager

```
                        VOYAGER Installation
                        ====================
```

Load Voyager and go in prefs menu. Then select "network", select "other",
then, on "mailto app", enter the following string:

```
                    c:mail2yam MAILTO %h
```

Use this settings and exit. Next time you load Voyager, when you click on
a "mailto:" reference, Voyager will launch Mail2YAM. Great!!!

1.12   ...on AWeb

```
                        AWeb Installation
                        =================
```

Load AWeb and go on "Settings" menu', then select "Change Settings...".
Click on the top button until the button name will become...

```
                "Network 3: External programs"
```

Ok, on the "Command" string gadget, enter:

```
                        c:mail2yam
```

Then, on "Argument" string gadget, enter simply...

```
                        MAILTO %s
```

Click on Save button. You are done :-)

1.13   ... on Ibrowse

```
                        IBrowse Installation
                        ====================
```

Load Ibrowse and go on "Preferences" menu', then select "Network" item.
Select   "E-Mail&Telnet" (last entry). Now select, on "Mailto" box,
"External", then type on gadstring the following line:

```
                    c:mail2yam MAILTO %h
```

Then, on Sendmail box, select 'External' and leave an empty string. Click
on OK, then save settings.

1.14   Greetings to...

```
                        Greetings
                        =========
```

Here is a list of all people that I want to greet:

Asha DeVelder (now mail2yam works!), John Harald Torp, Gregory Eycken (manga rules!), John Brooks (wait for new version of MNews), Olympic, Pagani Nicola, Ralph Seichter, Paul Layton, Thomas Szedlak, Warrick Burgess, Robert Daniells, Carol Harmond, Mike Hatch (official betatester)^1, Fabian Freiburg, Bertini Luca, Diciotti Massimo, Zironi Marco, Thorsten Zantis, Larry Smith, Joachim Thomas and Charles Patterson.

<div align="center">

(Excuse me if I forgot you...)
– Thanks everybody –

</div>
