

# MacFormat Checklist

Use this handy look-up guide to check your Mac's specifications against the system requirements mentioned in any of our reviews.

## What to look out for

CPU: what type of processor is fitted? All Macs and Mac-compatibles now use a PowerPC chip.  
 Speed: what's the clock speed?  
 RAM: how much RAM is installed?  
 Max RAM: ... and how much could you install in total?  
 Expansion: what are the main expansion slots and how many are there? Choose between PCI, NuBus, PDS, USB for iMac and PC Card for PowerBooks.  
 FPU: the Floating Point Unit speeds up complex maths work like 3D graphics. Is one included, either as part of the processor or as a maths co-processor? Or can you add

one as an option?  
 Mac OS: what is the latest version of the Mac OS your Mac can run? Some older Macs are not capable of running Mac OS 7.6 or 8, for example. (Note that you'll still need at least 8MB of RAM just to run Mac OS 7.6, and as much as 12MB to run Mac OS 8, even if your processor's up to the job.)  
 Mac OS 8.5: Apple is approving only its own PowerPC-based Macs for use with Mac OS 8.5; although most Mac-compatibles should be able to use the new operating system without difficulty, we list Apple's last official recommendation of Mac OS 8.1 in our listing below.
