7/18/2005 -- 3.3 Released

[New] The Information List (Entries list) now has a disclosure triangle. This expands to show the rows in the Info/Serials List contents.
[New - OS X Only] Info/Serials sheet -- an OS X sheet window is now available when holding the Option key and selecting an entry. In that sheet you can double click the info and that will bring up the Information Editor.
[New] Entries can now be exported/imported to/from XML. The XML isn't that greatly implemented and can't import XML from other programs.
[New] A Hidden Entries list has been added. It's now possible to hide an entry from being shown. This is useful when you have a lot of entries that aren't needed, but you want to save them and not see them. You must unhide the entry in order to edit/view it.
[New] Open Recent menu added. This is to conform more with Mac OS's HIG.
[New] Exporting info from the Info/Serials list is now implemented.
[New] You can now hide the Contact and Shown Info columns in the Entry List. This is controlled in the Database Preferences (Edit Menu).
[New] A rebuild/compact menu item has been added. This menu item allows for a compacting of the database.
[Change] Deleting multiple entries at one time is now possible.
[Change] Opening multiple entries at one time is now possible. That is, if you select multiple entries and click "Edit..." those entries will open.
[Change] The Info/Serials list now has strips. That is, every other row has a user selectable background color.
[Change/Fix] The Info Editor (New Entry or Edit Entry) windows now stagger on top of each other a little -- this is a basic stagger and may not work properly in some situations.
[Change] The carbon (OS X) runs as Mach-O now -- which should increase performance. However, this means that the carbon version will no longer run under OS 9. This decision was made because the PPC version worked better then the carbon version under OS 9.
[Change] Other changes here and there.
[Fix] Copying entries to other files is possible once again. You do this by dragging/ dropping files from and to other files.
[Fix] Copying Info/Serial rows is possible once again. You do this by dragging/ dropping those rows in the Info/Serials List.
[Fix] Assigning a new Contact in an Entry that was opened during creation of said contact now works.
[Fix] Info Editor did not have a title.
[Fix] New or Edit Info Editor gives title to the Entry Editor.
[Fix] Contact info (snail mail and net address) listbox's contents now line up with each other.
[Fix] Other bugs here and there.

7/28/2004 -- 3.2.4 Released

[Fix] Error while trying to print or export records.
[Fix] Delete button in "Information List" not disabling when no record was selected.

6/18/2004 -- 3.2.3 Released

{Fix - OS 9} Errors when saving entries in OS 9. Affected only PPC version or carbon
     running under OS 9 with CarbonLib installed. OS X was not affected.
{Fix - All} Progress window for converting 2.x files to 3.x file format now closes.
{Fix - OS 9} Program crashing due to out of memory and file corruption.

6/4/2004 -- 3.2.2 Released

{Fix} Version 2.1 files are not properly converted to 3.x file format.
{Fix} Default Registration Info is now included in Info Editors.
{Fix} Couple typos and small bugs changed here and there.

5/3/2004 -- 3.2.1 Released

{Fix}-{PPC and Carbon under OS 9) - Fixed a problem that resulted from what
     appears to be an Apple bug and the file system used. This problem only
     happened under: PPC version (either under OS X Classic or OS 9-below), and
     Carbon version under OS 9. Sorry for the delay of a working version for PPC
     users -- OS X users were not affected.
{Fix} - Error stating the version has expired. The final shouldn't have disabled it self,
     but it wont any longer.
{Fix} Other odds and ends.

3/25/2003 -- 3.2 Released

{New} Multiple Database Openings -- Can now open as many TSK files as you want.
      a. Swapping records from open files is possible
{New} Entry Types -- Saving any type of information is now possible -- without using
    fields that don't match their information.
     a. Default Types are: Software Registration, Website Passwords, Hardware Info,
    and Credit Card information.
     b. Columns can now be repositioned using the "Entry Type Editor"
     c. Fields can now added or removed from a Entry Type.
     d. Information currently stored in software registration fields can be converted to
    a correct type.
{New} Multiple Info Editors -- It is now possible to open multiple records at one time.
     a. Information from one record can be copied to another by drag and drop. The
    Entry Types have to match, however.
{New} Window Menu Added.
{New} Check For Update Added.
{New} Contact's Net Address Launching -- You can now "launch" a net address --
     email, web site, or other -- by either a contextual menu in the Information List

window or double clicking the address in the Information Editor.

{Change} Developers List is now known as "Contacts List". This was changed to reflect different types of information that can be stored. Also reference to "Developer" has been changed to "Contact"

{Change} It is now possible to edit a Contact by clicking the "Edit Developer..." button in the Information Window. This button was present in older versions, however, it did not open the developer.

{Change} File Format Change -- Old files are still read, however, once a file is opened it can not be read by older versions. A backup copy is created.

{Change} Contextual Menu in Information Editor can now copy all info fields. Previously it was only possible to copy Serial #1 and #2

{Change} Other changes here and there.

{Bug} Database Preferences dialog no longer requires password to be entered.

{Bug} Shown Info can be "Unshown" now.

{Bug} Other small bugs here and there.

2/27/2003 - 3.1.1 Released

[Fix] - Checking "Show" in a row in the "Serials List" now shows the serial in the Software List as it is suppose to.

[Fix] - Clicking "Edit Developers..." in the "Software Info Window" while a developer is selected now highlights that developer in the "Developer List"

[Fix] - Other small changes here and there.

2/21/2003 - 3.1 Released

[New] - All columns in lists can be resized by the user.

[New] - A serial can now be shown in the software list for each entry.

[New] - Row Reordering. Rows in the Serials list and all developer contact lists can be positioned where the user wants them. The positions stays in effect until the list is sorted.

[New] - Contextual menu in Software List. The menu shows "New, Edit, Delete, and Copy Shown Serial."

[New] - Contextual menu in Serials List. The menu is the same as the one for Software List, except it allows copying of serial 1 and 2 (if present).

[New] - A serial can now be dragged from the list to copy to a field in TSK or in another program. Only Serial #1 is copied.

[New] - Exporting can now be done to one complete file. Also, developer information can be included or excluded from the export.

[New] - The Software Information window can now be resized vertically by a disclosure triangle. Horizontal resizing is controlled by the user.

[Change] - Rows in the Developer address can now show 3 lines of text. The net address list displays 2 lines of text now.

[Change] - Developer Edit window can now be resized to any width and height.

[Change] - Updated contact information due to getting a domain for Byrd Soft.

[Change] - Columns in the Serials list have been moved around so that columns next

to each other are related.

[Change] - TSK application icon has been updated.

[Change] - Other small changes here and there.

[Fix] - Find now goes by the list's row position. So, if you search for "Test 1" and "Test 2" comes before it in the list, Test 2 will be found first. Also, Find works better.

[Fix] - Error 35 when exporting records has been fixed. The files that were exported were fine, however.

[Fix] - The Find window is no longer hidden by the dock. However, it does over lap the Software List and Developers List if needed.

[Fix] - Other small fixes here and there.

9/10/2002 - 3.0.3 Released

(Change) Interface changes here and there.

(Fix) Program Crash when trying to make new database using "New Database..." menuitem, when no database was open.

(Fix) Some Find window fixes

(Fix) Other small fixes.

8/30/2002 - 3.0.2 Released

(Fix) - Registration problems have been fixed.

8/30/2002 - 3.0.1 Released

(Change) - Very minor bugs fixed

8/29/2002 - 3.0 released

(Change) - The Serial Keeper is now shareware. It costs $10 US. You can register in the program or via a web page. Using the built-in way is faster to getting your serial number information entered in to the program. To add TSK's registration information to a database go to "Registration Info" in the Apple (Application menu in OS X) and click the button "Add TSK Info To File."

(Change) - File format has been changed to all easier feature adding and changing. TSK 3.0 can open TSK 2.x files. Those files will be converted to 3.0 format and TSK 2.x wont be able to open those files. A backup file of the converted 2.x file will be made and will have the same name with .old added at the end.

(Change) - Software list has been changed to be the main interface window and the information entry window to be open when editing a entry. This change was made to make it easier to use and other features. Other changes to this window have been made.

(New) - A serials list has been added to the software information entry window to all multiple serial numbers for one software entry. No more duplicate entries just because of a version change.

(New) - A developer database has been added. This database will store the

information of developers of the software entries. No more reentering information multiple times. The name of the developer also now appears in the Software List for each software entry.

(New) - Developer information storing has been changed so that you can store nearly unlimited contact information. A snail mail list, net addresses list, and phone numbers list will handle the data. Notes field still in place.

(New) - Font settings have been added to handle list fonts and printing font settings. There are 2 sets of list fonts, Main list font settings and other list font settings. Main lists are the Software List and the Developer List. Other lists are information lists.

(New) - Password confirm window when changing the database password.

(New) - You can now sort by Software title or Developer name.

(New) - Developer delete warning setting, to accompany the new Developer Database.

(New) - A Default Email address can now be set along with the default name and company of previous versions.

(New) - Serial number edit window to handle the old serial number information and new fields listed below.

(New) - Registered email field for serial numbers.

(New) - Version number field for serial numbers.

(New) - Order number field for serial numbers.

(New) - More find by choices. You can search by serial number for software entries and all types of developer information for developer entries.

(Change) - Toolbar has been removed in favor of controls in the Software List and the Developer List. The edit button defaults to allow opening of entries easier, by using the enter or return key.

(Change) - For now you can not launch a developer URL. This will change in future versions.

(Change) - Minor bug fixes and user interface changes. GUI changes where made to comply with the Apple Human Interface Guidelines for OS X.

(New and Changed) - Some minor improvements here and there and new features here and there.

10/5/99: Version 2.1 released

Fixed Bugs:

1. Printing bugs...Printing all records, wouldn't send data to printer...Printing more then one page of records, would print off the page.
2. Using the menu item "Save File As" would cause TSK not to recognize the file at next open, and using that saved file for the default file, would cause a Nil error. The menu item has been changed to "Backup This file" to avoid confusion.
3. Using the "Update" function when clicking on another record in the "Software Stored List" would overwrite the clicked record with the previous records info.
4. Other minor bugs.

Added items:

1. Price field
2. Purchase on field...to store the date of purchase.
3. Password to access the Database Preferences, it uses the same password as the
    open password. Also a checkbox to turn off requiring of that password to access
    the Database Preferences
4. Other minor changes.

8/18/99: Version 2.0 Released

2.0 is a total rewrite in a totally different programming language Some items have
    been saved from 1.0, but almost everything is different.

Warning: TSK 2.0 cannot open TSK 1.0 files. Sorry for any inconvenience this may
    cause.

Things Added in 2.0

-- Software Stored list, navigate all the software you have stored just by double
    clicking, or selecting (a checkbox in the Database prefs controls which is used) a
    Software's name.

-- Printing, you can now print one record, collect multiple records for printing, or print
    all records.

-- Second serial number field, since some programs use 2 serial numbers, 2 serial
    number fields are needed.

-- Software Notes field, store notes about the software.

-- Company Info, store information about the Software's maker.

-- Default name and company, have the program put a name and company you
    specify. It puts it in there when you click the add button, you wont see it be
    added, you can turn this on and off.

-- Default filename and location, you can change both the file name and location for
    the default database, and default file name for new files.

-- Contact info has been updated to reflect ISP change.

-- Balloon help, use the balloon help to see what stuff does.

-- Better record searching, you can now search for Software's name, Software maker,
    and Software notes. Also find next has been added.

-- A toolbar now houses all the record buttons. You can have the toolbar show up at startup, or not.

-- A Record menu, it does the same function as the toolbar, except it has commands keys

-- Contextual menu support, has the same functions as the record menu, and the toolbar.

--TSK is now drag and drop aware, you can also double click a file.

Bugs fixed:

-- Programs stored counter, it now counts the correct number of records.

-- Minor bugs fixed here and there that where in 1.0, nothing major, but since its a rewrite, you would expect that.

10/16/98 -- First released.
