

Set speed

Where $[F][x][y]$ means "set speed to $x*16+y$ ". Though it is nowhere near that simple. Let $z = x*16+y$. Depending on what values z takes, different units of speed are set, there being two: ticks/division and beats/minute. If $z \leq 32$, then it means "set ticks/division to z " otherwise it means "set beats/minute to z ". Default values are 6 ticks/division, and 125 beats/minute.
