

### Cut sample

Where  $[E][C][x]$  means "after the current sample has been played for  $x$  ticks in this division, its volume will be set to 0". This implies that if  $x$  is 0, then you will not hear any of the sample. If you wish to insert "silence" in a pattern, it is better to use a "silence"-sample (see above) due to the lack of proper support for this effect.
