Overview

To successfully manage software development, the project leader must determine:

- 1. *Scope* of work to be done**
- 2. *Risks* to be incurred**
- 3. *Resources* that will be required**
- 4. *Tasks* to be accomplished**
- 5. *Effort* (cost) that will be expended**
- 6. *Schedule* to be followed**

Software project management begins before the technical work starts.

Software project management ends when the software is retired.
