1.2   disclaimer

```
                     1. Disclaimer
----------------------------------------------------------------------------
```

FFNews is supplied "as is". You use it at your own risk. The author is not
responsible for any damages or data-losses it causes. FFNews is Shareware.
You may try it out thirty days. If you want to continue using it you must
register. Look here for information about
                     Registration

1.3   introduction

```
2. Introduction
----------------------------------------------------------------------------
```

You are fed up with all available Usenet clients available for the Amiga?
You are sick about loosing the database (or your harddisk) every 2 weeks?
You just want a simple, easy to use but yet powerful Usenet Client?

Then FFNews is something for you!

1.4   requirements

```
3. Requirements
----------------------------------------------------------------------------
```

Minimum:

    - AmiTCP/IP or Miami (other stacks *might* run)
    - Kickstart v37
    - WB v37 (2.0)
    - 1 MB free RAM
    - MUI v3.3

Recommended:

    - Kickstart v39 or better
    - Workbench v39 or better
    - >1MB free RAM
    - Newest MUI

FFNews will support, if available:

    - term.mcc (for the ANSI Display)
    - mailtext.mcc (better display of the mailtext)

1.5   terminology

4. Terminology

RFC
        Request For Comments (Internet)

SMTP
        Simple Mail Transfer Protocol (RFC 821, TCP/IP)

TCP/IP
        Transmission Control Protocol/Internet Protocol (RFC 793, IP)

NNTP
        Network News Transfer Protocol (Internet, RFC 977, Usenet)

POP3
        Post Office Protocol 3 (Internet, RFC 1939)

Client
        Program, that makes an Internet service usable to a User.

Signature
        Sometimes, .signature file. A file that, when placed in
        your home directory on your public-access site, will
        automatically be appended to every Usenet posting you
        write.
        Most have their email address, their homepage, and usually
        some punchline or saying. Some even have pretty ascii-art.
        Recommended is not to exceed the proposed limit of 4 lines
        as signature.
        A signature should always begin with "-- " whereby the character
        after the space should be a return (linefeed+carrige return)
        That line is not counted as signature line :)

Cookie
        An inane/witty/profund comment that can be found around
        the net.
        Mostly selected randomly from a file and appended to the
        signature.

Usenet
        Imagine a conversation carried out over a period of hours and days, as
        if people were leaving messages and responses on a bulletin board.
        Or imagine the electronic equivalent of a radio talk show where
        everybody can put their two cents in and no one is ever on hold.
            Unlike e-mail, which is usually "one-to-one," Usenet is
        "many-to-many." Usenet is the international meeting place, where
        people gather to meet their friends, discuss the day's events, keep up
        with computer trends or talk about whatever's on their mind. Jumping
        into a Usenet discussion can be a liberating experience. Nobody knows
        what you look or sound like, how old you are, what your background is.
        You're judged solely on your words, your ability to make a point.
            To many people, Usenet IS the Net. In fact, it is often confused
        with Internet. But it is a totally separate system. All Internet
        sites CAN carry Usenet, but so do many non-Internet sites, from
        sophisticated Unix machines to simple bulletin-board systems running

on old XT clones and Apple IIs.
(taken from the EFF's Guide to the Internet, v. 3.1 by Adam Gaffin
Copyright 1993, 1995 Electronic Frontier Foundation, all rights
reserved.)
If you want to know more about what usenet is and how it all works
you can get that file from the EFF online archives at ftp.eff.org,
gopher.eff.org, http://www.eff.org/, EFF BBS (+1 202 861 1223), AOL
keyword EFF, CIS EFFSIG forum, and elsewhere. It is free of charge.

1.6 installation

```
5. Installation
-------------------------------------------------------------------------------
```
Just unpack the archive to wherever you wish FFNews to reside.

Now click on the Install icon or start the supplied script
"Install" via shell if you know how :-)

1.7 configuration

```
                6. Configuration
-------------------------------------------------------------------------------
```

It will come in very handy to know some Information beforehand.
FFNews will need the following Information in order to work:

    o the name of the Newsserver (or the IP Number respectivly)

    o your real name (a quick look at your birth-certificate will reveal this
                    incase you forgot :)

    o your email address

    o the name of your POP3 and SMTP mailserver (or the IP Number respectivly)

    o your username and password for your mailservers.

If you happen to miss any piece of Information from above, don't hesitate to
contact your Internet Service Provider and ask him for the missing
Information.

Just start FFNews. After a short nerve requester and some time to startup,
there should be a MUI window waiting for you.

Go to the Menu "Settings" and select the Submenu "FFNews"
(I will explain all the Menuentries and what they do later)

A window will pop up and you will see a listview on the left with the
following entries:

Info, User, News, Email, External, FFNews, Cache, Headers, Mail Display,

Filter, Mailing Lists, Cookie Shuffle and Printer.

The right view is obviously the according view for the different entries.
This is where you will be filling in the requested Information.

By default, the selected entry is "Info" and you should be seeing the FFNews
logo and if registered, your name and an additional comment. If you have not
paid anything to the author but see a name in the "Info" section, please
immediately delete the file ffnews.key in the same directory as the main
program.

Configuration items:

> User
>
> News
>
> EMail
>
> External
>
> FFNews
>
> Cache
> Headers
>
> Mail display
>
> Filter
>
> Mailing lists
>
> Cookie shuffle
>
> Printer

1.8   c_user

Enter your real name, your email address, and if you wish, your
organisation. That organisation is not really important, you can leave it
blank or use the default value.

1.9   c_news

You will see 2 folders. One named "NNTP" and one named "Articles". "NNTP" is
selected by default.
Please enter your newsserver and check with the "Connect!" button, if the
newsserver is accessible (exists). If you have the Information from your
Internet Service Provider, the newsserver should work and be accessible. If
the "Connect!" will give you a warning, that the newsserver does not exist

or is unreachable check if you are online (obviously it can only check if
you are online) and if you are, check the spelling. If you are online, the
spelling is correct and you still get a message stating the connect has
failed, try to contact your Internet Service Provider and ask him for
another newsserver for you.

With the cyclegadget named "Connect on startup" , you can let FFNews connect
on either:

> o always

> o if online

> o never

Suggested setting is: if online. FFNews will only try to connect to your
newsserver if it finds AmiTCP/IP or Miami is running.

The "Articles" Folder.

Set the number of articles you want to be warned at if exceeded.
Enter the path of your signature file.
You see to non-excluding checkboxes. One named "Re-show old articles in list?"
and one named "Read in new after post?".
The first checkbox will make FFNews keep old articles and will reshow them
in the list. The second checkbox will make FFNews read in headers again,
after you posted. That way, you can easily check if your posting has arrived
at least at your newsserver.

Suggested setting: first checkbox not set, second checkbox set.

1.10 c_email

Next entry is "Email" Again we see 2 Folders. One named "SMTP" and one named
"POP3". The "SMTP" is selected by default, if you click on the "Email" entry.

Your have to configure the "SMTP" folder if you want to be able to
reply to postings yourself. If you don't you won't be able to
comment someones posting via email.

Enter the name of your SMTP mailserver. The next stringgadget is by
default set to "same as before". This "same as before" refers to the email
address you have given that will show up if people reply to your postings
via email. If you wish to (and have the ability) you can set them differently,
so that email answers from postings and your urealn email correspondence go
into 2 different accounts (which you can do, if you have 2 different
accounts).

The email address you set here is the address the receiver can reply to,
if you sent the author of a posting an email.

The next folder named "POP3" is optional. You only need to configure this
if you also use FFNews as your email client. (though this is recommended :-)

The folder "POP3" has 3 stringgadgets named "Mail server (POP3)", "User name" and "Password".

At the first stringgadget you enter the name of the POP3 mail server, the second stringgadget you enter your username and at the third you enter your password for that POP3 mailserver.

1.11 c_external

You have to set your editor you wish to edit your emails with. If in doubt you can always use either ED or MEmacs (both supplied with the Workbench distribution) or preferably use an own editor of choice. Refer to Aminet for a wide choice of editors.

The checkbox will tell FFNews to either use the internal and few-featured editor. If you check that checkbox FFNews will pop up your external editor of choice you have entered above when posting or replying automagically. Suggested setting is on.

The next, a cyclegadget will let you choose the way FFNews should handle attachements. You can either use "internally..." or "with this viewer:" in which case you should supply multiview or something alike. If you choose "internally..." please note the current internal viewer is only able to load pictures. If you want a more comprehensive viewer, toggle the cycle gadget and enter "MultiView" in the string gadget on the right.

Set the Path, where files should be decoded to.
Set it, if possible, to some directory on your harddisk(s) because if you crash your machine somehow, the files will not be lost. If you use T: as path, the files won't survive the next reset but won't fill your hard disk. This of course depends where you have located the T: assign.

You can also supply an URL Arexx script if you wish. It will work much as the URL Arexx script in Amirc. The script will basically accept an URL as parameter and will spawn a World Wide Web viewer of you choice with the desired URL. There is a script supplied in this distribution. Just click on the popup button of the string gadget and select the "SendBrowser.rexx" script.

1.12 c_ffnews

You should see 6 checkboxes named:

o "Iconify on window close?"
   If you check that, FFNews will iconify itself when you click
   on the closegadget.

o "Cut off foreign signature?"
   If you reply to some posting via a followup or via email, the
   foreign signature will be cut off for you, thus saving you having

        to delete it yourself.

    o "Show logo?"
      Will show the logo in the main FFNews window.

    o "Show eMail "groups"?"
      Will treat Mailing lists as Newsgroups.

    o "Wrap lines to 80 chars?"
      Will wrap the lines to 89 characters when replying.

    o "Auto-Save prefs on exit?"
      Will save the preferences automatically when you exit FFNews

1.13   c_cache

    You see 2 checkboxes and 2 slider-gadgets.

    One is named "Cache index files?" and the other is named
    "Cache body and head?".

    The first will make FFNews cache only the index files. In those files
    FFNews stores the quick index on the articles to build up the article
    list. If you deactivate this, you must read in the article list a new
    time if you restart FFNews.

    The latter will make FFNews cache the article and the header itself.

    Caching header and body implies caching indices, so ticking this check-
    box the other one will be selected and ghosted.

    Your settings must depend on whether you want FFNews to be an Online
    or Offline newsreader. If you want to download all the new articles
    at a time, disconnect and read them later, tick both.

    If you have non-stop connection to your newsreader and don't want any
    articles cached, set the "Cache Header/Body" checkmark to off. Whether
    you set the "Cache Index files" to on or off is up to your personal
    taste. I suggest settings it to on.

The 2 slider-gadgets should be selfexplanatory.

    The first lets you set the maximum size in kB under which limit the posting
    should be downloaded automatically. A good idea would be to set it to
    around 5 kb. If a posting exceeds that limit, it will not be downloaded. You
    will have to download it manually i.e. click on the article in the message
    list.

    The second slider-gadget named "Silent delete after (0=never)" will let you
    set the amount of days you wish to keep postings. 0 means you want to keep
    the cached postings forever and delete them manually at some future moment.
    Any other value will make FFNews delete postings after that time. Please
    note: Silent delete is done while the article list is loaded in. So if there
    is nothing happening while loading the article list, FFNews is deleting old
    obsolete articles. Also note FFNews will silently delete *any* article,

even unread ones.

1.14   unnamed.1

You can set the string you want to use when replying to a posting and mail.

The special strings you can use are:

```
\n   New line
%gr  Actual newsgroup
%au  Author of article to reply
%da  Date of article to reply
%id  Message ID of article to reply
%su  Subject of article to reply
%now Date now
```

Examples:

```
\nOn %da %au wrote about "%su":\n\n
\nYou wrote in %gr:\n\n
```

1.15   c_display

You should see 2 checkboxes and a cycle-gadget.

The 2 checkboxes named:

o "Show header/attachments?"

   FFNews will show you the header and attachements section in its
   display window. If you disable this you will have more room for
   the display itself.

o "Show button panel?"

    Will show a button panel in the display window where the
    posting will be shown.

In general, tick both checkmarks, unless you are already known with the
shortcuts in that display window and know how to deal with the header and
attachements.

The cycle-gadget (which controls the look of the button panel) has three
options:

o "Text only"

o "Image only"

o "Text+Image"

Very much self explanatory I would think.

1.16 c_filter

2 string-gadgets are to be seen. One named "Author Filter" and the other is
named "Subject FIlter". Both accept the standard amigados wildcard
patternmatching. Please refer to your AmigaDOS manual if you are unfamiliar
with the AmigaDOS patternmatching. This filter currently only works for
the article list, not for the download or scan process.

1.17 c_mlists

You can add mailing lists and delete them.
This is useful if you use FFNews not only as an Usenet Client but also as your
Email Client.

The important thing is "Header for recog.". You have to enter a unique header
string where FFNews should recognize this mailing list. If you already have
some emails from this mailing list, read the complete header and find ←
    something
like "Reply-To: ". Then enter this line in the string gadget.

1.18 c_shuffle

Here you can either enter cookies yourself, or import a textfile that has
cookies. Cookies will be appended to your signature. You don't need to
add cookies, of course.

1.19 c_printer

You see 2 checkboxes and a cyclegadget.

One checkbox is named "Use ANSI styles (bold etc.) in printout?" and the other
is named "Do form feed?".

If you tick the first one, the printout will use the ANSI styles and will ←
    print
things in bold as bold etc. – This looks better on most printers.

If you tick the second one a form feed will be sent to the printer after ←
    printing.
Useful for bubble jet printers or such to throw out the printed sheet of paper
at the end.

The cycle-gadget will let you choose if you want to have "No Header", "Short ←
    Header"
or "Long Header" printed with the posting. Suggested settings is "Short Header ←
    ".

1.20   usage

7. Usage

As you have somehow survived my weird configuration explanation,
we will now advance to actually using FFNews.

First, let's look at the menu structure.

 Project
    Connect
        This makes FFNews connect to the NNTP server of your choice. You must
        have configured one to use this, of course.

    Disconnect
        This makes FFNews disconnect again. FFNews actually does not disconnect
        if AmiTCP/IP or Miami wants to shut down, so you need to do this manually.

    Write New Email
        Lets you write some Email to somebody.

    About
        I guess that is pretty obvious what this does. If it isn't, just try it.

    WWW Support
        With this fine feature you always get the newest information on FFNews.
        If you click this, FFNews will connect to its homepage on the World Wide
        Web, download the current news bulletin and show it. You must have
        HTMLText.mcc installed for this (Installation should be done by the
        supplied installer script)

    Quit
        Makes FFNews jump out of memory, take the hoover, clean up your flat,
        doing the washing up, ironing your clothes, doing the shopping and
        finally talks to god.
        Rely only on the first, the latter is plain luck :)

 Window

    Outgoing Queue
        Here all your buffered postings will land. If you read your news online
        you should not need to use this. This window will pop up if you connect
        and have pending cached postings/emails waiting.

    URL Grabber
        Grabs all URL's that appear in postings. This list is saved with the
        main preferences. Double click to give over this URL to the ARexx script
        specified in the preferences.

    News Search
        Lets you search news for something specific.

        Search
            Will make a window pop up.

        You can tick the search times you want to search for.
        The search items are: "Author", "Subject", "Date", "Message-ID"
        and "Body".

        In the string-gadget you can enter the searchstring. You can use
        the standard AmigaDOS patternmatching. Refer to your AmigaDOS
        manual for further details about the AmigaDOS patternmatching

    Last Results
        Will make a window come up and show you the last results of
        your search.

  Online Feedback
      If you have suggestions, bug reports, great ideas or just want the
      author to know what a good job he has done, this is the menuentry to
      select.

 Settings
  FFNews
      Will let you configure FFNews.
      A window will pop up and you can select the different items you
      wish to configure.

  Groupmanager
      This will bring up a Newsgroupeditor which will let you subscribe
      or unsubscribe newsgroups. Should be rather simple to use.

  Adressbook
      Keeps track of adresses. Very simple thing really. This list is
      saved with the main preferences.

  Load Settings
      Lets you load the default settings.

  Load Settings as...
      Will let you load settings which have a different name.

  Save Settings
      Will let you save the current settings as default.

  Save Settings as...
      Will let you save the settings somehwere else and under
      a different name.

  Export
      Will let you export the settings as ASCII. This may be useful for
      future news readers to import or if you want to have your cookies
      or grabbed URLs saved to one file.

  MUI
      Will let you configure the MUI settings of this program.
      For further explanation what MUI is and what it can do,
      please refer to the MUI documentation.

1.21   getstarted

```
8. Getting Started
--------------------------------------------------------------------------
```

Finally, we made our way through the configuration, know roughly what the
Menus do and want to get onto the Usenet and use FFNews.

For the following steps you need to be online, so please connect to your
Internet provider.

At first, you need a list of available newsgroups at the server you
are connecting to.

Select the Group Manager either via the button or via
"Settings/Group Manager" and then press simply on "Get List from Server"
FFNews will automatically connect if you have not selected connect now
beforehand.

Don't worry if this takes a while. Just let it work.

And while the Group Manager is getting the newsgroups you might have asked
yourself what the buttons below mean. Of course I will explain this when you
need it :)

Once you have the list of newsgroups you can easily subscribe by
double-clicking on the newsgroup you want to subscribe. The newsgroup
will show up in the right listview now. To get rid of it again, double-click
on the newsgroup in the right listview and begone it is.

I recommend to start of with a newsgroup that ends with ".test". The
newsserver your Internet Service Provider has given you should at least have
one newsgroup that ends with ".test" . Most Internet Service Providers have an
own newsserver and most probably a local (only on that newsserver available"
test newsgroup. If not, any odd newsgroup ending in ".test" will do for now.

And before you fall asleep about all that theoritical stuff, we now just use a
simple example so you can see how things work.

I, for example, subscribed inf.ml.test (a testing newsgroup I know is local,
so you don't need to bother to search the newsgrouplist up and down in the
hope to find it. You won't. Unless you study where I study...)

Straight after subscribing and saving the subscription list, FFNews will try
to read in all the new (well in this case, since you joined the group for the
first time, all news in that newsgroup are new to you (or better FFNews))
postings. It will warn you, if the amount of new postings exceeds a
configured limit. Remember you set that limit in Setting/FFNews,
News item, Articles folder ??? If not, hum.. maybe rtfm :-) ?

Good. Double-click on the newsgroup. A new window will pop up. The listview
will give you the following information: Newsnumber, R (for article's status),
Author, Subject, Date and KB. Double-click on the thing that interests you
like "Sex for free" as subject or whatever attracts your attention in that
short header description. FFnews will get the article and you will be able to
see it.

If you want to get all articles at once, press the "Scan all" button at the
main window. This will make FFNews get all headers and articles from all
subscribed newsgroups. Saves you online time and cost. If you want FFNews to
only scan some of your newsgroups, select them and click on "Scan selected".

After FFNews has finished that, you may disconnect, continue to be online or
whatever. FFNews has all it needs and you can happily read the news.

I assume you have logged off, after pressing that devious button and FFNews
has finished getting all new postings.

Now double-click on a newsgroup and a new window will pop up.
The following buttons are available:

    o "Post new Article"
        Will let you post a new article to the newsgroup

    o "Delete"
        Deletes article(s) currently selected

    o "Mark as read"
        Will mark all currently selected articles as read. This is helpful
        if you have old, unread articles left in the folder and think there's
        just braindead stuff in them.

    o "Read in"
        Will read in all the articles you have selected if you have only read
        in the headers. If you are offline, this button is of minot importance.

    o "Fetch old portion"
        If you are missing some articles, for example if there were so much
        new articles you limited the amount, then use this button. You must
        be online to use this feature.

        Now there's a window with two sliders. Select a specific range and
        press on the button below.

    o "Invert Selection"
        Obvious I think. Toggles the state of all lines in the list. Unmarked
        items will become marked and vice versa.

    o The cycle-gadget that will let you sort by number, author, subject and date.
        Sorting by date is fine, but rather slow in the current FFNews. Sorting
        by subject gives you something like threading (which will be implemented
        later), sorting by number is nearly as good as sorting by date.

Now Double-Click on a headerline and, surprise surprise, a new window will pop
up. This will display you the message. It may take some seconds until it really
pops up, depending on you having image buttons or not.

At the bottom there should reside a button panel. The items should be rather
self-explanatory.

In that message window you have some shortcuts, and only in that window they
are valid :)

```
* Cursor right/left  : next/previous Message
* Shift+Cursor r/l   : next/previous NEW Message
* Space              : next NEW Message (shorty for Shift + Cursor Right)
* r                  : Reply
* R                  : EMail-Reply
* h                  : Short/Long header (toggle)
* e                  : Export
* n                  : new posting
* N                  : new email
* g                  : activate newsgroups window
* m                  : activate message list window
* !                  : ROT13 encode/decode
* Del                : Delete the current displayed article
```

1.22 arexx

```
9. Arexx Commands
-------------------------------------------------------------------------------
```

POST SUBJECT/K,GROUPS/M/F

  New posting, subject with keyword (optional), you can set one, many or no
  newsgroup. If a posting is already being processed, a warning requester will
  be opened.

NEWMAIL TO/K,SUBJECT/K

  New email, receipent and subject with keyword. You will also see a warning
  requester if an email is already being processed.

CHECKMAIL POPANDOPEN/S

  Checks, if new emails have arrived and downloads them. If that is the case
  and POPANDOPEN is set, FFNews will deiconify itself and will open the email
  folder.

  That way you can make a script, that will check every few minutes,
  if new mail has arrived.

DISCONNECT

  Just as the name would imply. Makes FFNews disconnect from the newsserver

SCAN ALL/S,GROUPS/M/F

  Scans either all or specified groups and downloads new postings. The limit
  set "read if less than" will of course be checked and obeyed.

Snail:          Thorsten Stocksmeier
                Lemgoer Strasse 19
                32657 Lemgo-Brake
                GERMANY

EMail:          flavour@teuto.de

Phone:          on request

IRC:            flavour on #amigager (best chances to meet me are ~18.00 GMT)
```

1.26 problems

```
13. Main problems / Known bugs
-------------------------------------------------------------------------------

Of course FFNews has bugs and problems.

I will mention the central flaws here so you know what you're buying.
```

o FFNews is *slow* when opening a folder. This is because it does not use
  an indexing system i.e. every article is cached in three files, not in
  a central index file. This may be included in the future.

o Threading is not implemented. If you really need this, wait for a newer
  FFNews release or chose another newsreader.

o FFNews might still have some Enforcer hits. The problem with the hits is they
  don't occur on my 030/50. If you find ANY, please immediately report them,
  stating the exact situation where it happened.

o FFNews is kinda memory hungry. Quite unfixable. You have to live with it.

o FFNews does not take over a very long subject to the posting window when
  replying. This will certainly be fixed.

o FFNews only uses one network socket. Reading in headers is VERY slow compared
  to strict online newsreaders such as mNews. This may or may not be fixed.

I hope you still like FFNews :-)

1.27   registration

                 14. Registration

                 Registration form
                 If you want to register FFNews, please send US$20 or 30DM in cash ←
                     to me.
Currently there are no other methods of payment supported such as
FirstVirtual. (though I would like to have a FV account)

With your registration you get your FFNews key file that will work with
any forthcoming updates! (This does not include completely new releases
e.g. if FFNews goes commercial or such)

IMPORTANT: I need three things to send you the key file

    a) the money ;-)

    b) your exact real name. Your key will disable the "real name"
       string gadget in the preferences and put in the name it is
       registered to. Don't give any nicknames here but the name
       you want to have as your real real name!

    c) your EMail address. Your server must accept short uuencoded
       files as your key will be sent through it. I won't send
       around disks or such.

Please click on "Registration form" above and print it out.

**FFNews registration**

I want to register FFNews and receive a personalized key file for it.

My personal data:

Name:
        ---------------------------------
EMail:
        ---------------------------------
Address:
        ----------------------------------------------------------------

Real name to use in FFNews:
(leave blank if same as b4) -------------------------------------------

Following fields are not required for registration, fill in if you like.

Phone:
        -------------------------

Amiga system (500, 1200,...): A      running KS: V  .   WB: V  .
                               -----             -- --       -- --
I have    MB FastRAM and a 680 0 processor running at    MHz.
        --                    -                         --
What's your current "level" on the Amiga?

    [ ] Beginner
    [ ] Advanced
    [ ] Programmer (highest level :-)

Other equipment (CD-ROM, Printer,...):  ----------------------------------

------------------------------------------------------------------------
```

Copyright information: You are not allowed to give your personalized key
file away to anyone. No one except you may use it. You are not allowed to
sell the key file after a while. With this registration you do not acquire
rights on FFNews i.e. you do not buy the program but the key file. With
your signature you accept this.

As a registration fee I have included US$20 or 30DM in notes.
