ASL	Icon		Serial
Audio	IFFParse		Timer
Battclock	Input		Translator
Battmem	Intuition		Trackdisk
CIA	Keyboard		Utility
Clipboard	Keymap		WorkBench
Commodities	Layers		Reqtools
Console	Locale		Bullet
CX_lib	MathFFP		Appshell
Ddebug_lib	MathIEEEdoubbas		IFF
Debug_lib	MathIEEEdoubrans		
Diskfont	MathIEEEsingbas		
Disk	MathIEEEsingtrans		
DOS	Mathtrans		
Exec	Misc		

1.2 About Autodoc-It

AUTODOC-IT helps you to control all those autodoc-files you have generated with
ad2ht

It presents the
autodocs
in a way that you do not
need to load every autodoc when you need its specific information.
Just click on the reference you want information about and then return
to your programming environment.

Always use the "Retrace"-Gadget to get back from a subitem.
Use the HELP-Key to display some help about the Amigaguide-Reader
itself. To return to AUTODOC-IT, just click the lower (!) close-
gadget.

Version history:

=====

New features for version 1.0:

- first release, nothing much to say about this one

New features for version 1.01:

- corrected some minor bugs

New features for version 1.10:

- found some typing-mismatches.
- changed 'link amiga.lib' to 'link amiga_lib'...
- added credits

New features for version 1.11:

- changed user interface design (thanks to T.Strauß)
- updated installation information (some guys had problems with
cross-references (most of them did not read the manuals of amigaguide...)).
- corrected some minor bugs
- added 2.0 version string
- added version history
- added arexx-script (T.Strauss) for cross reference feature, it does not
work if include: cannot be found (see above). Use this script at your own
risk. You do not need it, if you follow the converting instructions of
AD2HT correctly!

New features for version 1.12:

- added reqtools (cross reference should work: try "screen" in
'rteasyrequesta', it should find 'intuition/screens.h'). The reqtools
converted file is not included, cause it is too long (>20000 bytes) for
'z-netz/amiga/bin'. You should be able to convert it on your own anyway.

New features for version 1.13:

- added Workbench 2.1 enhancements (bullet.doc, appshell.doc)
Please convert your autodoc-files supplied with the 2.1 package with AD2HT accordingly: asl.doc, bullet.doc, locale.doc, commodities.doc
- added iff.library (convert ifflib.doc included in the ifflib release)

1.3 About Autodocs

Autodocs are programmer maintained documents that are embedded in the source code for an application, utility or system software. Using a special tool called Autodoc (located on DevCon disks and the Software Toolkit) these documents can be extracted from the source, indexed, alphabetized and placed in a human-readable form.

1.4 About

AD2HT is fully documented in the amigaguide reference guide. It is ↔ used to convert your autodoc-compatible doc-files into hypertext format.

Note however, that you must have your C_Includes in a directory 'include' or any directory assigned to 'include', to let AD2HT find them. If you convert your

autodocs without regarding this, cross-references will not work with AUTODOC-IT!

1.5 Credits

Credits for help, suggestions, flames etc... must go to the following persons:

Thomas Strauß - for realizing additional features, testing and criticism

And Commodore for the amigaguide-package.

VOYAGER@TREFF.ZER
