SttttttS2.7Guide

1.1   SttttttS V2.7 guide.

```
                    SttttttS V2.7
        Manual for registered and demo version.

Program made for logging adverts into teletextstations.
No internal connections, just plug and run.

            © Copyright 1995
            Kjetil S Matheussen
            (Beware, this guide is shit. Read the Norwegian one.:-)

1.2   Chapter 1. Introduction

```
In Norway, we have two TV-stations, which have Teletext
with the possibility to send in your own advertisements via Phone.
SttttttS emulates the phonesounds and sends it through a cable
you buy very cheap from me. The cable can be connected between any
amiga and most telephones.

SttttttS is made especially to log adverts into teletextstations
in a fast and simple way. The program is fast, easy to use and
has lots of possibilities.

This is an Amos program, and that means that you can multitask
just by pressing the left amiga + a.

SttttttS means: Snyt Tv To's Tekst Tv Tjeneste Skikkelig. or:
        Cheat Tv channels Teletext advertisement
        service Real.
```

1.3   Chapter 2. Editor

```
I think you will understand it.
```

1.4   Chapter 3. Menues

```
Shouldn't be too hard to understand.
```

1.5   Chapter 4. Buttons at the right.

```
Not too hard to understand this one either.
```

1.6   Chapter 5. Direct mode.

```
Here, you can type your adverts directly via sounds.
```

1.7   Chapter 6. Transmit advert.

```
It's too much for me to interpret, so I will just explain the most
important. I will now, explain some of the buttons at the bottom
of the screen.

TV-channel: TV2: Sends the Teletextpage first, and then the advert.
      TV3: Just sends the advert.
```

```
wasted: Not so important

Pauseconfig: No.2 is the only one which is working. When there are
        two similar sounds, an error often occurs. Therefore
        its smart to have an extra break between these sounds.
```

1.8   Chapter 7. Configuration file.

```
The file itself should be self-explaining, and can
be edited in a text-editor.

If you can't make it work, please check the following:

1. Check line 131 and 132 in your locale-file. The name and position
   of your config-file should be written here.

2. Line 133 in locale: The "on" declaration, written in capital
   letters.
   Line 134 in locale: The "off" declaration, written in capital
   letters.

3. The file must be at least 50 lines long. (very important)

4. The first variable at line 2, second at 5, third at 8 and
   so on.
```

1.9   Chapter 8. Soundkeymapediting.

```
This is perhaps the most important file. And it shouldn't be
too hard to understand. It looks like this and should be
in S: or in the current directory:

"
  0123456789*#
 +------------
0|          0
1|ABCDEFGHIJ1
2|KLMNOPQRST2
3|UVXYZÅÆØ W3
4|.,?!"-&+: 4
5|          5
6|          6
7|          7
8|          8
9|          9
*|
#|

Space: 56

Delete: *9
"
```

The file must be at least 19 lines long.

1.10   Chapter 9. SttttttS locale.

SttttttS now supports Locale. Well, its not real locale, like in
wb3.0. But clean ascII files you can edit in a text editor.

To do:

1. Load "SttttttSLocale.english" into a text-editor.

2. Interpret to another language.

3. Save the file as "SttttttSLocale.<language>". It must be present in
   the current, or in the S: directory.

4. Write in cli: SttttttS2.7 <språk>.

If you translate into a new language, I would be very happy if you sent
me the file. If you do, you will always be placed in the credit-list,
in the future, and you will recieve the last version of SttttttS
registered version. And if you translate the configfile and the
keymap file, you will recieve a cable too.

1.11   Chapter 10. How to register.

                 There are two versions of this program:

1. The registered version:

   1. The Programs SttttttS V2.7, SttttttS V2.7 demo version,
      The games Kjetlis I og Kjetlis II, the databases
      Fastbase 1.2 preview og List 1.3.
   2. 1 cable from your Amiga to your telephone.
   3. Information about updates. Future diskupdates will
      just cost postage+disk. Look
              chapter 11
              .

   This will just cost 100
              NOK
               for normal use and 300 NOK for
   commercial use. Posting will cost you about 10 NOK.

2. The
              demo version
              . This one is PD, and can be distributed freely.

To register:
1. Write your name and address.

2. write if it is for private or commercial use.
3. Send 100+10 or 300+10 NOK.

Norwegian Post giro: 0826 0813839, Kjetil S Matheussen, 3864 Rauland.

1.12   Chapter 11 How to update the program.

Read the Norwegian manual, which is <<<MUCH>>> better.
If you are a foreigner, I will interpret everything important for you.
So, buy this program!

1.13   Chapter 12 Credits and Addresses.

+------------------------------------------------------------------+
```

1.14   my name, address and telephonenumber:

```
Kjetil S Matheussen
n-3864 RAULAND

TLF: +47 35 07 35 23
```

1.15   Norwegian kroner

```
NOK is the Norwegian valuta.

1$ is about 6 NOK.

1£ is about 10 NOK.
```

1.16   The demo version

```
The only difference between the registered version and the
demo version, is that you can't transmit faster than 30
DTMF sounds per minut in the demo version.
(and that's very slow, I have managed to send with the speed
840 in the registered version)
```
