             Thanks
                – 2000.03.03 –

## 1.2  NetChess - How to use?

 NetChess V0.95

 This is a little chess program. You can play a game with your friends
 on internet or a localnet.

 First step: start the exe.

 A console and a board window will be open.

 Second step: consulting your friend.
 The white is the server always.
 The black is the client.

```
If you want the white:
 Type "white"+enter, you are the server, and wait for client connection.
 If you abort it, press CTRL+c.
 (Because of some problems in this version, plz restart the program, if you
 want the server again.)

If you want the black:
  Wait for white player make the server.
  If he make it, type black (server host).
  WARNING! Never push CTRL+c!
  If you type bad host or ip, plz wait 1-2 mins, and the
  program go back to main> automaticly.

Eg.: black dial-28.karanet.hu

How can you step?

You can step, with use console. Type coordinates to move.

Eg.: a2a4

if you want quit, type "q" or "quit", and press enter.

Bug report:

You can't change the peasant when arriving the opposit side.
No checkmate detection!

History:

0.95 - Bad check warnings, fixed!

If you find other bugs, plz report to me!

mail to: mmlada@freemail.hu    subject: NetChess V0.94 bug report

ehh.. sorry for my bad english.. :|
```

## 1.3  NetChess - Requirements

```
 Requirements:

 a running TCP/IP task
```

```
unused port: 3493

some memory: about 100kbyte

network

other player

030/50 because my draw routine is very slow :-), but
    playable on 020 with some fastram

50kb disk space

some free space in workbench screen for the game windows
```

## 1.4   NetChess - Installation

```
Installation

no need library or other files...

just run the executeble, and play
```

## 1.5   NetChess - Contact

```
