

## **BLANK**

NAME BLANK - Blank the screen.

### SYNTAX

blank

### USAGE

Blank can be used to blank to screen. With servers this saves the screen phosphor from overburning. There is a similar program BLANKER, which can automatically blank the screen. BLANK must be run separately to blank the screen. However BLANKER requires quite a few threads. It is more economical to have a separate tool for blanking the screen in situations, where there is a shortage of memory. You can set the screen blanking as a program to some of the PMSHELL groups.
