This is version 7.0 of the Chkbook program. This version requires that you download and run the conversion program (ckbkcv.zip).

Copy pxengwin.dll and bwcc.dll to your main Windows directory. Copy pxchkbk.exe, pxchkbk.hlp to the same directory you ran the conversion program. Install as a program item in the program manager.

You will no long have multiple files in multiple directories. All entries will be placed into one set of database tables by the conversion program.

If you have Borland's Paradox, you can use it to do your own thing with the data in the tables.
